

Handwritten text in a cursive script, likely a historical manuscript or a set of instructions related to the diagram above. The text is arranged in several lines and appears to be a detailed description or a set of instructions related to the diagram above.

We are the angels mixed with apes.

There are many stories... Of men mixing with angels.
The truth is, we are the angels.

We are the ones, who mixed with the great apes. The other hominids.

The truth is we made diplomacy and bred with them—and the DNA evidence shows this. We basically had sex with them. And they wanted to have sex with us.

For you see, we are the ones who mixed with the apes. They gave us strength; we gave them beauty and intelligence.

Our faces did more than attract mates. They navigated the entire course of human society.

We bred together across tribes and regions, becoming the first and only species to create diplomacy—not through treaties, but through mutual recognition of beauty as a bridge.

A handsome face signaled health, intelligence, and good genes. It disarmed strangers and invited cooperation. Much of our diplomatic status came from how we presented ourselves.

Before language could fully articulate trust, the face already promised it.

In tribal structures, women were often exchanged as gifts between groups—a transaction of beauty and alliance.

Men, by contrast, were evaluated as leaders. The better looking the man, the more the room would look to him to lead. That ancient calculus remains embedded in us.

We still follow the face that signals competence, symmetry, and strength.

The truth is that the ancient caveman was beautiful—a supermodel, even. True, they probably lacked hygiene. They had beards; their hair was scraggly and messy, with loads of dirt. But underneath all that existed a man—or woman—whose proportions would catapult them to the front of the fashion world.

So the question remains...

If people in the old times were beautiful... by lifestyle and force of movement alone... why can't we recreate it?

The answer is: we can. And that's what we aim to do in this book.

- Pollution from factories, cars, and even household pets has sunk our cheeks.
- We no longer chew thoroughly compared to the bones, sinew, and roots our ancestors tore apart, reducing our jaw and palate size.
- We ingest plastics that cause neoteny (retaining juvenile features) while paradoxically accelerating hairline recession.
- Our tongues are weak from disuse.
- We would once squint against the sun all day, building razor-sharp, deep-set eyes.
- The wind would help shape our face over time, a natural de-ager
- Our noses has become bell-ends, from gravity instead of needing to hoist it up from breathing, remember people practically ran marathons back in the day
- Our necks have atrophied, sinking forward due to constant use of our phones and looking down while we walk
- Our eyes bulge out, constantly staring at a small screen
- Our cheeks have sagged from gravity but also lack of use, we no longer socialize all day like we used. The constant frowns and smiles would build up our face like an athlete.

Are you getting it yet?

You're ugly.

It's society's fault.

But, my job is to fix it.
And fix it... I will.

I'm Nyx

I'm here to help you train to guide you through
exercises and introduce you to concepts.

I understand. Some of you think this may be
nonsense. I get it.

But here's what I want you to do: give me the first
twenty hours.

Please take before and after photos.

YELLOW BELT

BLUE BELT

GREEN BELT

BLACK BELT

For reference let's categorize four large steps in the Vostok Method:

- 20 hours - yellow belt
- 40 hours - blue belt
- 70 hours - green belt
- 100 hours - black belt

During these hours, your goals will shift significantly.

Belt	Hours	Exercises	Massage	Refinement
 Yellow	20	90%	10%	0%
 Blue	40	65%	30%	5%
 Green	70	50%	40%	10%
 Black	100+	20%	40%	40%

And you may not want to become a supermodel. And, That's okay.

Your goal for now, Is just to do this, x2 a week for the next year, and then you're done.

And never have to do it again.

Don't worry—this might sound complicated at first. It isn't.
The only other variable here is oil. There are many types, but we'll simplify them by viscosity—how thick or “grippy” an oil feels when rubbed between your fingers.
Lower viscosity (more slippery): better for massage and refinement
Higher viscosity (more grip): better for exercises where control matters
Many of these are marketed as “hair oils,” but they work just as well on skin. Always test a small area first to check for any reactions.

Oil Categories

Grapeseed Oil

Light and clean. Excellent for sealing in hydration.

Wash your face, sanitize (silicic acid), rinse again, then apply grapeseed oil over slightly damp skin to lock in moisture.

Coconut Oil

The standard. Thick, smooth, and reliable.

Hydrates well without excessive irritation and doesn't require aggressive washing. This should be your default for most workouts.

Almond Oil

A balanced middle ground.

Easy to work with, easy to wash off. Slight scent, but overall very practical.

Castor Oil

Extremely thick—almost resistant.

Best used sparingly. Ideal for targeted work like cheeks where you want strong resistance. Also known to support hair thickness—useful for eyebrows and eyelashes.

Rate of Progress

Most people slightly overestimate their baseline—by about half a point to a full point, much like height. With that in mind, a practical benchmark is this: roughly 40 hours of consistent Vostok work equates to a one-point improvement on the scale.

In simple terms, if you begin at a 6/10, 40 hours of disciplined effort should move you toward a 7/10. And when that shift happens, the world responds—subtly at first, then unmistakably.

Progress should be steady, not aggressive.

Aim for 1–2 hours per week as your baseline.

Maximum: 2 hours per day

Upper limit: Sustain that pace for no more than a week

Then: allow for proper recovery, just as you would in the gym

Overtraining is counterproductive and can lead to irritation or nerve stress. This is a long game—precision matters more than intensity.

Lastly, if you see this symbol...

This means the exercise targets asymmetry, too. Ninety percent of the battle is asymmetry. Try chewing on one side for a week—you'll develop an uneven jaw quickly. Try raising one eyebrow or smiling unevenly. Asymmetry sets in fast. Compound that over a lifetime, and you'll see why ugliness takes over.

With asymmetry exercises, go slow. Feel the imbalance in your face.

For your first time, do the workout almost entirely on one side.

You can feel asymmetry, but sometimes you can see it too. The mirror lies. Take an unflattering straight-on selfie with your phone—that's where the truth shows.
