

The Anchor: The Lift You Don't See

The reason we're starting with the back of the head is that nearly *everyone* has shit posture.

We walk around hunched over our phones, and that tension reduces the angles of our jaws. You've got a turkey neck and look old as shit because you sit on your phone all day.

The back of the head is the silent guardian of posture, of a sharp jaw, of angled cheeks, and even of de-aging, since it grabs tons of extra flesh and sets it back.

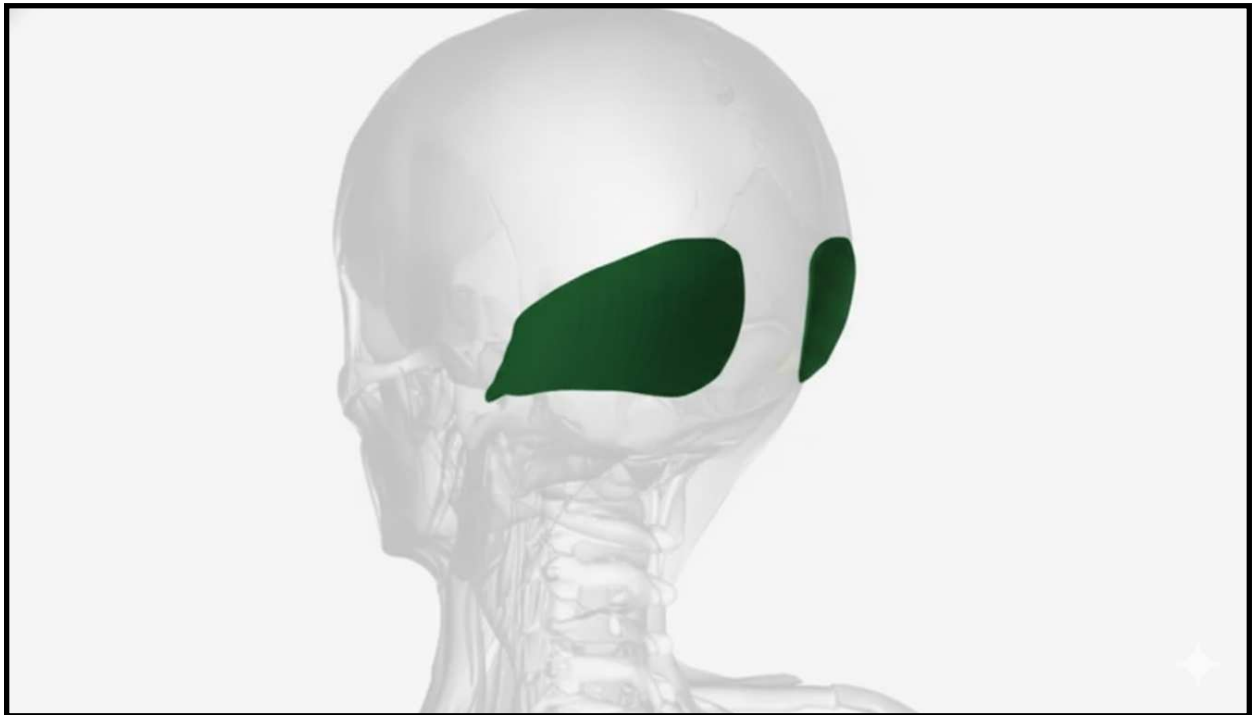

You don't have to believe me. Just try it.

Muscular Exercises

Chapter 1: The Back of the Head

1.0 - Occipitalis

Necessary to do as it makes the forehead more narrow and allows for blood circulation through the neck, relaxing the traps and upper body.

This is a weird muscle, the scalp doesn't have a lot of muscles, it's just hard tissue but this is one of them.

What the Occipitalis Muscle Does

Primary Function:

This muscle is primarily responsible for managing and moving your brows but it's other purpose is to keep your scalp looking young by being able to stretch back and forth.

How to Work the Occipitalis

(Note: This muscle is passive—it can't be "bulked up," but you can improve its tone and relaxation.)

Scalp Push Forward Exercise

Goal: Activate the occipitalis gently.

Sit upright, place fingertips at the base of your skull (just above the neck).

Push the scalp forward and push head down, push your fingers down with the occipitalis. Resist with your fingers.

Beginner: 15

Intermediate: 20

Expert: 50

Master: 100

OPERATOR NOTES: THIS WILL CAUSE A WRINKLE IN THE FOREHEAD, THIS PARTICULAR EXERCISE (BUT WE CAN ALWAYS COUNTER THAT BY MAKING THE FRONTALIS STRONG AND MASSAGING THE FOREHEAD CORRECTLY). BUT, IT CREATES A MORE “NARROW” AND POINTED SIDE OF THE FOREHEAD.

Scalp Push Down Exercise

Goal: Activate the occipitalis gently.

Sit upright, interlock the fingers, placing palms on the occipitalis, simply push forward.

Beginner: 15

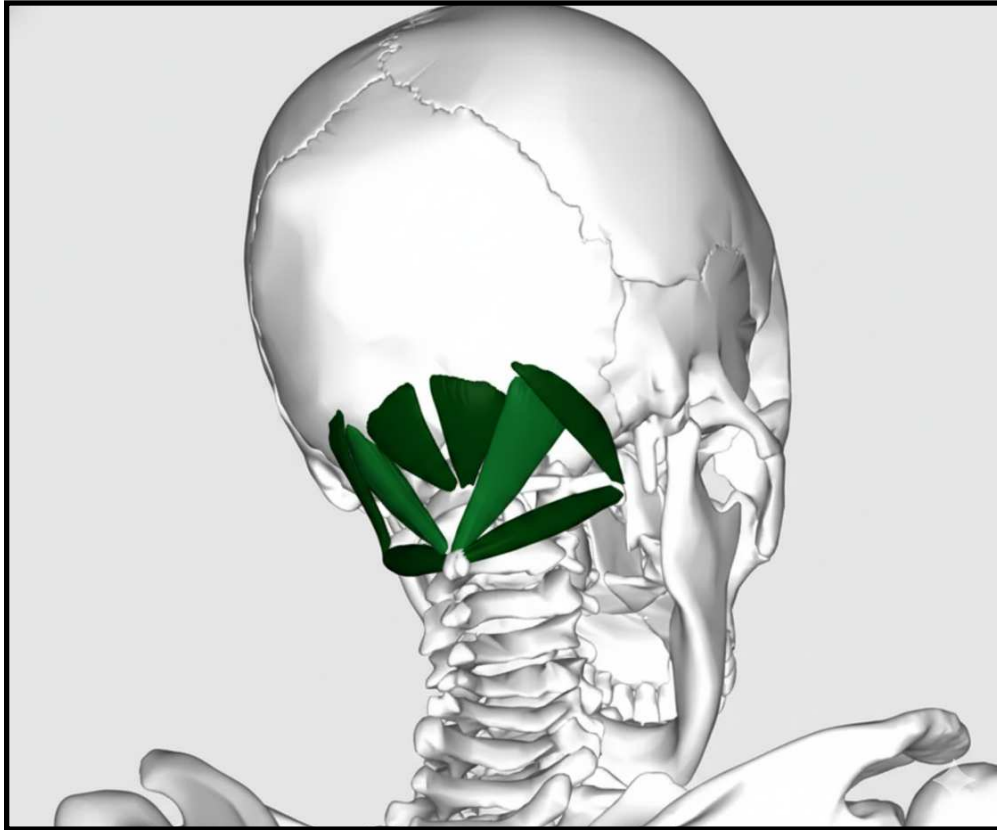

Intermediate: 20

Expert: 50

Master: 100

OPERATOR NOTES: THIS EXERCISE WILL DO THE EXACT SAME AS ABOVE, BUT WITH AN ADDED BONUS, IT WILL MAKE THE MUSCLES IN BETWEEN THE NOSE AND EYES AND EYEBROWS STRONGER. GIVING A MORE 3D APPEARANCE, SORT OF. IT WILL STICK OUT THE BROW, IF OVERDONE, CAN GIVE A BIT MORE OF A “CAVEMAN” APPEARANCE BUT THIS MUSCLE IS SO WEAK IN MOST PEOPLE, IT SHOULD BE WORKED. OVERALL, A GREAT BENEFIT TO DO. REMEMBER, WE CAN RELAX THE BROWS AND STRENGTHEN THEM TO COUNTER THESE EFFECTS.

1.1 - *Suboccipital Muscles*

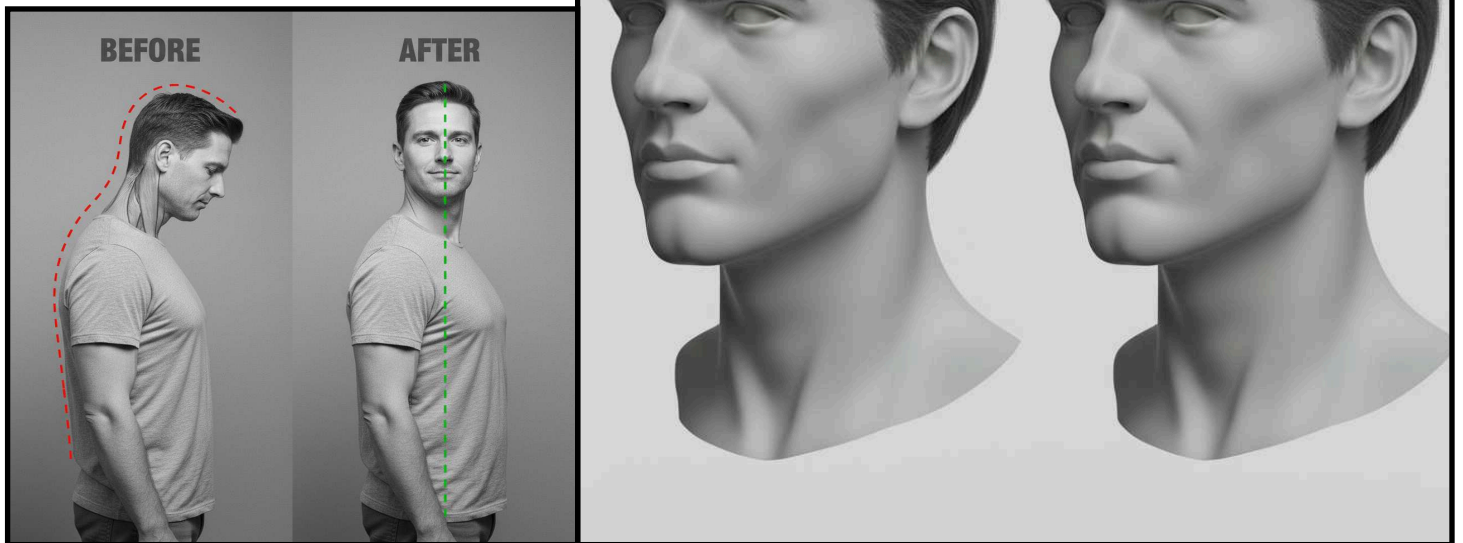

The suboccipital muscles (a group of four small but powerful muscles at the base of the skull) are critical for head movement, posture, and proprioception.

Why Train Them?

Reduce headaches: Suboccipital tension is linked to cervicogenic headaches. Improve posture:
Counteracts "text neck" and forward head posture.

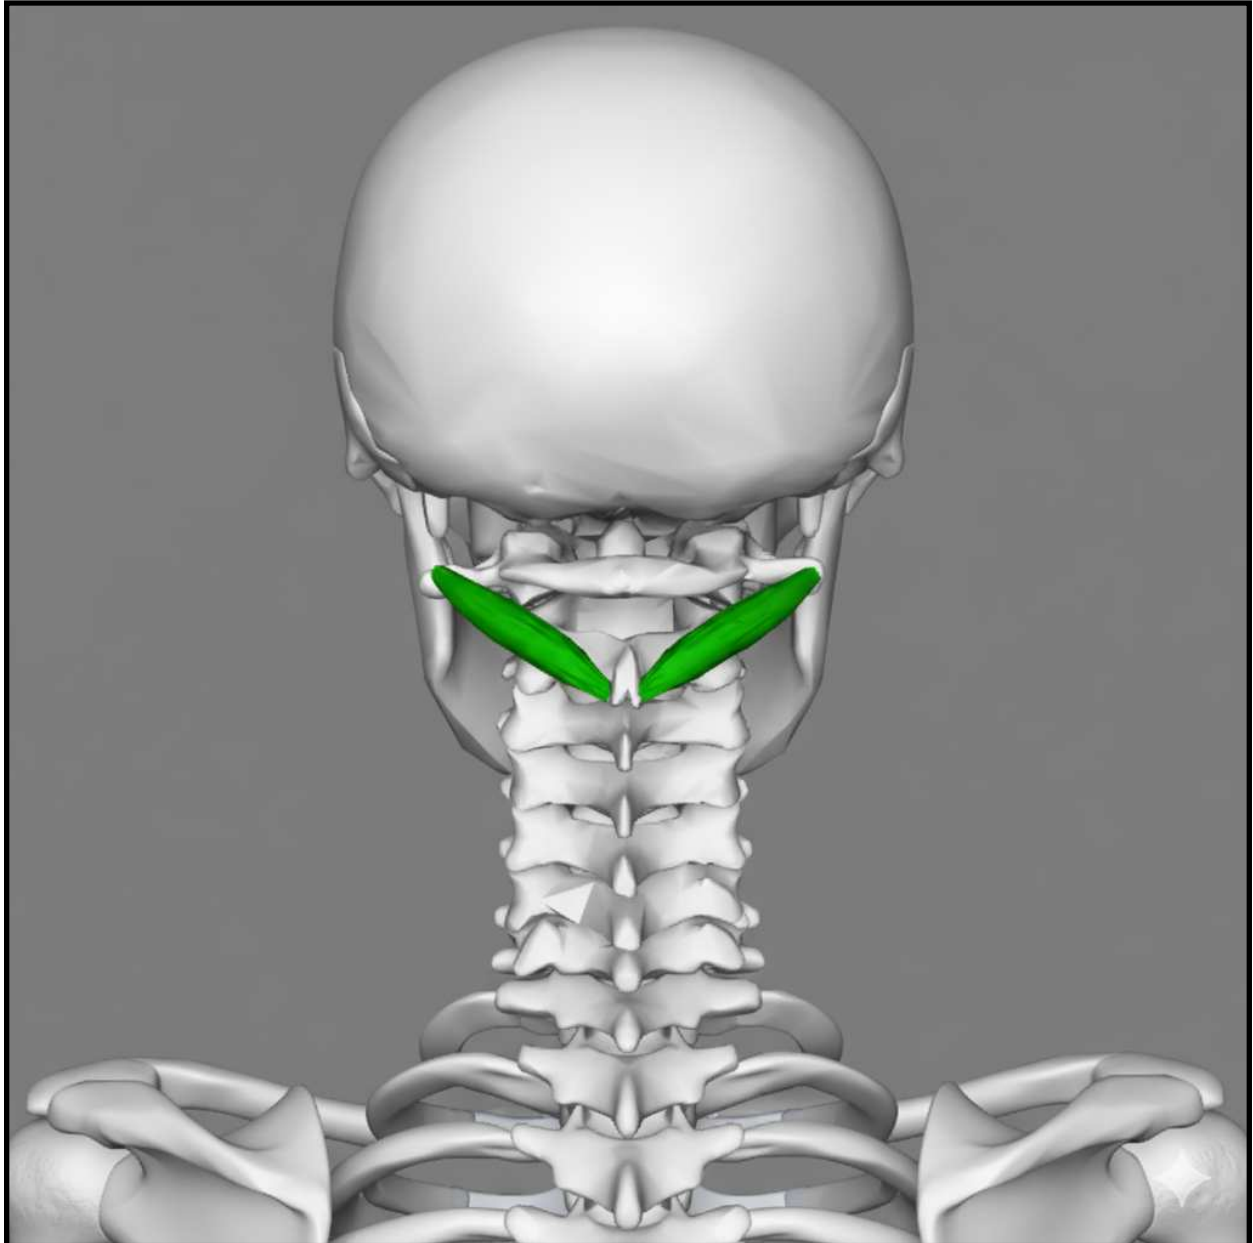

Enhance athletic performance: Critical for sports requiring head control (e.g., boxing, swimming).
Bonus: The suboccipitals have the highest density of muscle spindles (proprioceptors) in the body—they're your "GPS" for head position!

These
Muscles
Do...

Obliquus Capitis Inferior

Creates “almond-like” eyes. Man this one feels good!
Lowers the head naturally down onto the top of the neck, creating a more “imposing” appearance.

OPERATOR NOTES: BECAUSE WE SIT ON OUR PHONES ALL DAY, THIS IS THE WEAKEST MUSCLE IN OUR NECK. IT LEADS TO “GOLEM NECK”, BAD POSTURE, BAD BREATHING AND EVEN TURKEY NECK. NECESSARY FOR BALANCE, EVEN FEELING GOOD, BREATHING GOOD AND THE MOST UNDEVELOPED MUSCLE TODAY.

(Note: This muscle is deep—focus on precision, not force.)

Resisted Head Rotation *(Seated or Standing)*

Sit tall, tuck chin slightly.

Press the opposite hand palm against cheek or jaw, so if turning left, use your right hand for maximum resistance. Rotate head to the right while gently resisting with your hand. No need to extend the head all the way. Alternatively you can also hold this position for deeper stretches and less repetitions.

Beginner: 30

Intermediate: 60

OPERATOR NOTES: BESIDES LOWERING THE HEAD TO SIT NATURALLY ON THE NECK AND STRETCHING THE NECK MUSCLES TO GET RID OF TENSION FROM SITTING BEHIND A KEYBOARD ALL DAY, IT ALSO NARROWS THE LOWER EYELID - GIVING AN ALMOND EYE-LIKE APPEARANCE. NOT TOTALLY SURE HOW, BUT I BELIEVE IT STRETCHES THE SKIN OF THE SCALP. NOT A DEAGING TECHNIQUE, BUT A TECHNIQUE FOR CREATING BEAUTIFUL EYES.

Cervical Rotation with Extension

Rotate your head 60 degrees to one side as if looking behind you. Use your opposite hand (so if moving left, right hand) to grab the opposite knee firmly for resistance. Tuck your head back, all the way, do not use any other resistance. You'll want to grab your chair with the same hand.

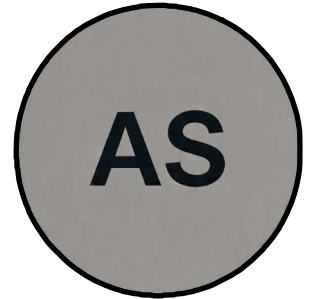

Beginner: 20

Intermediate: 30

OPERATOR NOTES: LESS EFFECTIVE BUT YOU'LL FEEL YOUR WHOLE BACK "CRISS-CROSS", AS IF THE MUSCLES IN THE BACK ARE MOVING. THIS WILL RELAX THE SPINE AND FORCE YOUR HEAD DOWN, AS IT NATURALLY SHOULD, SIT ON THE TOP OF THE NECK. YOUR NECK MUST BE STRAIGHT AND YOUR HEAD DOWN, BUT MOST PEOPLE HAVE THEIR NECK CRANED FORWARD AND THEIR HEAD SITTING "UP" ON IT, THE EXACT OPPOSITE WHICH LEADS TO SHOULDER TENSION, BAD BREATHING AND AS WE KNOW BAD BREATHING LEADS TO A RECESSED JAW AND FLATTER NOSE TO SUCK MORE AIR.

Rectus Capitis Posterior Major

This is a major source of neck pain from asymmetry of the muscles.

Suboccipital Isometric Holds

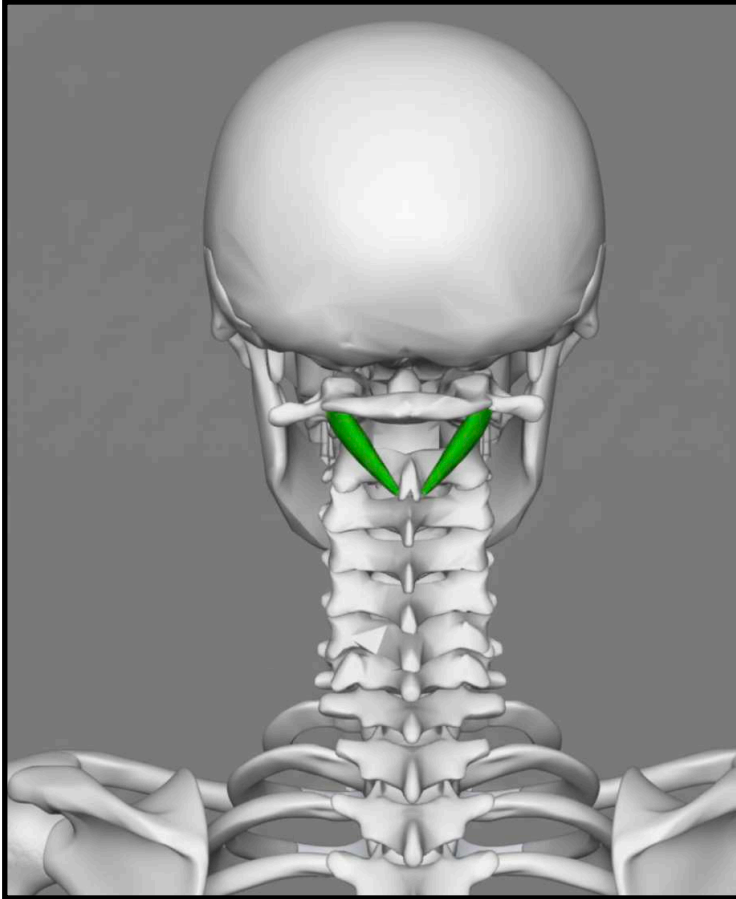

Nod chin slightly toward chest. You'll want to sit very upright.

Twist the head - 30 degrees to one side and down, return the head to upright position. So, start sitting down, head straight up, then tilt the head down and thirty degrees down with your jaw leading. It's very hard to feel this muscle, use no resistance with your hands. Move the skull from upright to this downward position back and forth. It's very tough to work this muscle out.

Beginner: 30

Intermediate: 60

OPERATOR NOTES: FEELS UNBELIEVABLE, RELAXES THE UPPER EYELIDS AND LOWER FOREHEAD, GIVING A "CALM" EXPRESSION. THIS IS ONE OF THE MOST

IMPORTANT ANTI-AGING EXERCISES TO DO. BECAUSE IT STRETCHES THE SKIN ON THE SCALP AROUND THE HAIRLINE AND IT BRINGS THE HAIRLINE DOWN. AS WE AGE, OUR HAIRLINE (MALE AND FEMALE) NATURALLY RECEDES, THIS MUSCLE IS ONE OF THE MAJOR REASONS WHY (BESIDES COLLAGEN LOSS NATURALLY). THIS MUSCLE BRINGS THE HAIRLINE DOWN. IT ONLY GETS WORSE BECAUSE WE'RE COMPUTERS AND PHONES (NOTICE HOW ALL NERDS HAVE A BAD HAIRLINE).

Controlled Head Rotation + Extension

Key Safety Note: This is a high-risk maneuver. The "pops" you may feel are cavitations in the facet joints of your cervical spine (C1-C2). Aggressive or improper technique can lead to joint injury, nerve impingement, or vertebral artery strain. Discontinue immediately if you feel sharp pain, nerve tingling, dizziness, or headache.

Starting Position: Sit or stand with a tall, neutral spine.

Rotation: Slowly rotate your head approximately 45 degrees—this is halfway to looking over your shoulder.

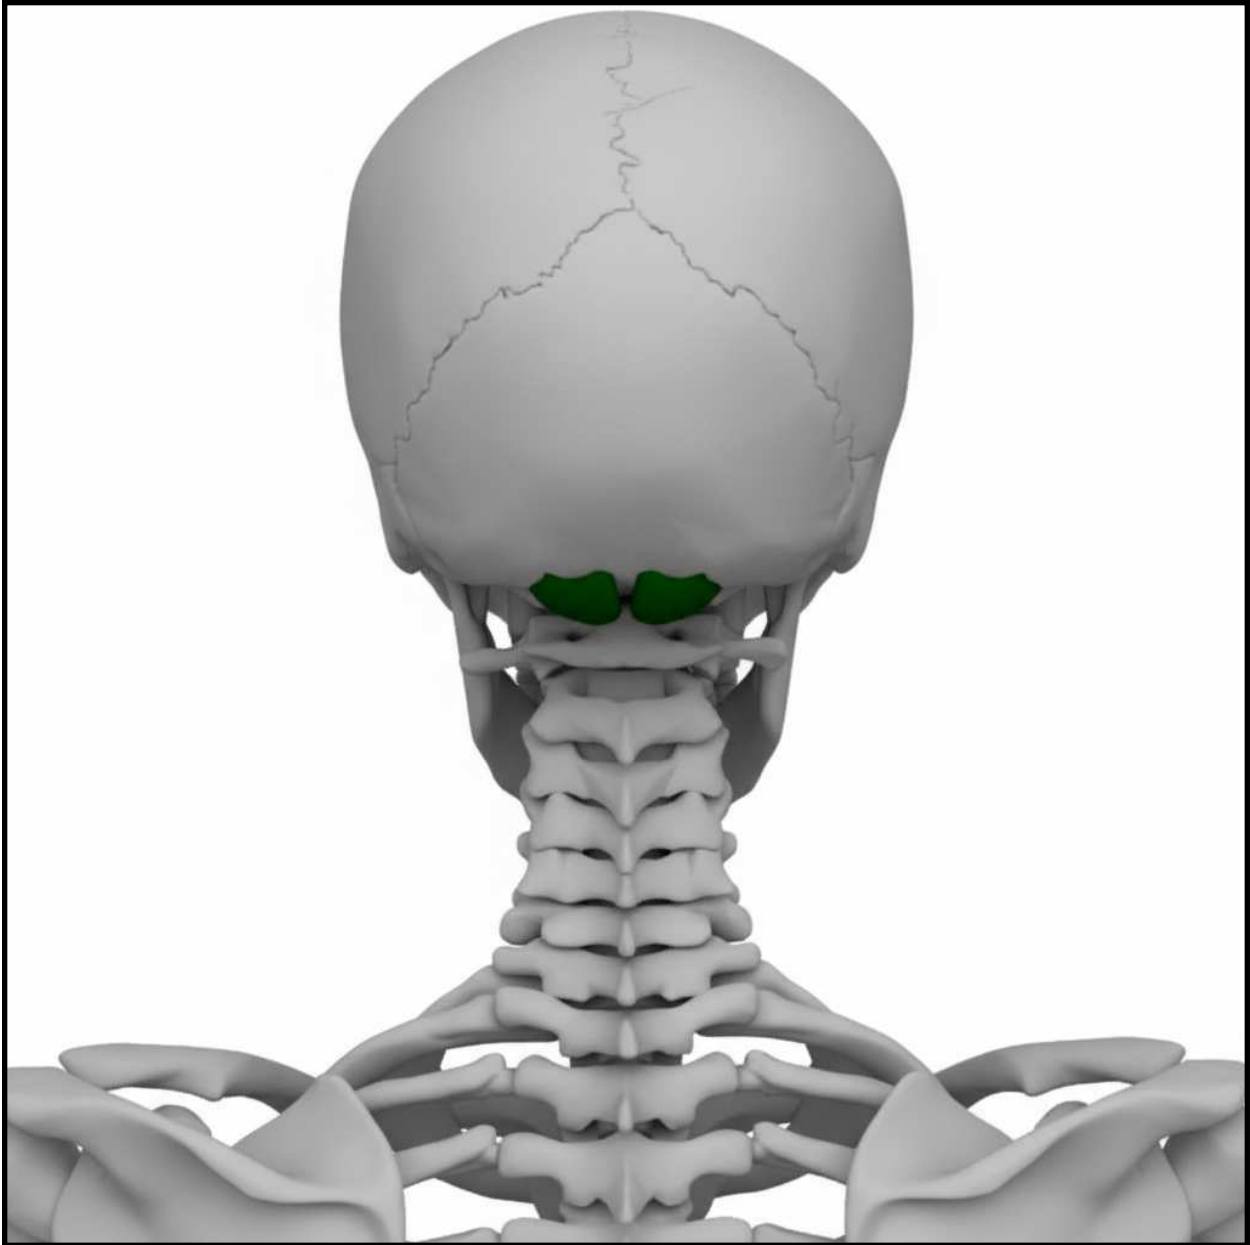

Your nose should point toward your shoulder's front edge, not past it. From this rotated position, perform a very small, controlled nod as if to look slightly up and back. The motion is tiny—think of trying to bring the back of your skull toward your upper neck on the rotated side. Do not throw your head backward.

Optional Resistance: Place your hand against the side/back of your head (on the rotated side) to provide gentle, isometric resistance as you attempt the small nodding motion.

Beginner: 50

Intermediate: 75

OPERATOR NOTES: AN EVEN BETTER EXERCISE. VERY RELAXING, RELEASES TRAPEZIUS AND SHOULDER TENSION, AS WELL AS NECK TENSION, RELAXES UPPER EYEBROW AND EYELIDS. I BELIEVE IT WILL HELP PREVENT WRINKLES. REDUCES HAIRLINE. WILL HELP STICK OUT THE CHIN INTO A BALL-POINT.

Rectus Capitis Posterior Minor

Primary Actions:

Head Extension: Assists in tilting the head backward. You know when someone shows a signal of surprise or disgust and they tilt their head back, that's pretty much entirely this muscle.

Suboccipital Isometric Push

Sit/stand tall, tuck chin slightly. Place fingertips on the base of your skull (just above the neck) - do this gently! You will feel your fingers "pull apart" if you're doing this correctly. Gently press your head backward into fingers without moving.

Start at 50,
Graduate to 100

OPERATOR NOTES: THIS WILL FIX A LOT OF POSTURE ISSUES, YOU'LL FEEL YOUR BACK STRAIGHTENING OUT, REDUCE AND REMOVE "GOLEM NECK" OR "TECH NECK". WILL MAKE BREATHING EASIER THROUGH THE NOSE. WITH CHIN EXERCISES WILL HELP MAKE THE FRONT OF THE CHIN MORE PROMINENT. FOR WOMEN, IT HELPS THEM STICK OUT THEIR BREASTS MORE.

Controlled Chin Nods

Goal: Engage RCPmi during subtle movements.

Make the neck and head perfectly straight (it helps to sit) then nod chin the straight down, as if making a "double chin." The Correct Motion: It is a posterior translation or a retro-cervical nod. Imagine your head is on a shelf.

Without tipping it up or down, you slide it straight back along the shelf. Your chin tucks in and back, creating folds under your chin—the "double chin" motion. This directly engages the deep suboccipital muscles, including the RCPmi, as they contract to pull the base of your skull toward the spine.

Beginner: 10

Master: 60

OPERATOR NOTES: WILL HELP CORRECT FOREHEAD WRINKLES AS IT STRETCHES THE SKIN ON THE FOREHEAD, HELPS EXTEND THE NECK FOR A GRACEFUL AND LONG NECK.

Obliquus capitis superior

Importance - Proper neck posture, easier breathing, sharper jaw

(Note: This muscle is deep and small—focus on precision, not heavy resistance.)

Suboccipital Isometric Holds

Sit/stand tall, tuck chin slightly. Place your fingertips lightly on the back of your head (just above the neck). Gently press your head backward into fingers without moving.

Beginner: 50 Times

Intermediate: 100 times

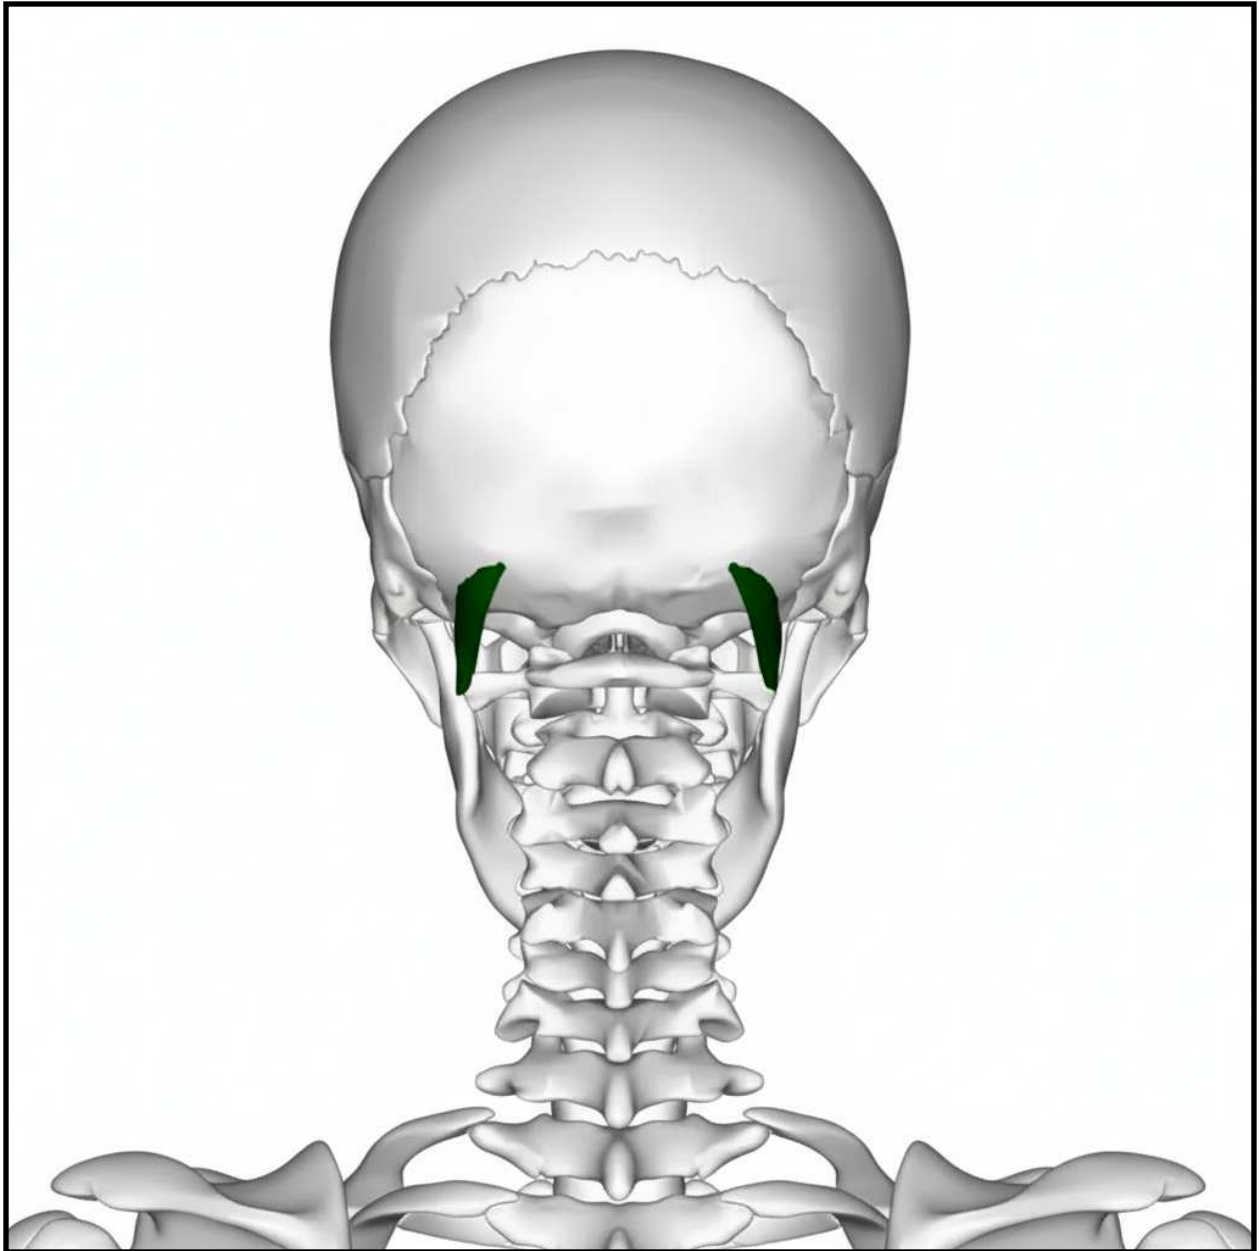

OPERATOR NOTES: THIS WILL MAKE THE SIDES OF THE JAW “POP-UP” OUT MORE, THIS IS THE JAW CELEBRITIES HAVE. MOST CELEBRITIES GET THIS TYPE OF JAW THROUGH FILLER OR AN IMPLANT ALTHOUGH SOME MALES HAVE THIS NATURALLY.

Chin Nod + Rotation Combo

Goal: Integrate obliquus with other suboccipitals.

Nod chin slightly toward chest. Rotate head 45 degrees to one side (do not turn your head all the way).

- Lift chin slightly (feel tension at skull base). Do not use your hand on the back of the head but you can

use the hand of the opposite side you are facing to brace the back of your neck.

- You'll feel the neck tense, then proceed to move the skull back and forth (meaning, up and down diagonally from the floor), forwards and backwards.

The muscle will strain very easily. From the direction you are facing, is the side you are working out.

- It helps to close one's eyes when this exercise is done to help visualize the muscle, as it is so small.

Beginner: 30

Intermediate: 60

Slow and methodical is the best way to do this exercise.

Massages: None

Refinement: None

The Jaw of Command: A Primal Blueprint

A weak, recessed chin signals uncertainty. A strong jaw broadcasts strength and trust. For our ancestors, powerful jaws meant survival—chewing tough food, displaying health and dominance.

Today, soft diets leave jaws underdeveloped. Most "fixes" are gimmicks—chewing gadgets that ignore alignment and true strength.

This chapter is different.

We'll reposition your bite and rebuild foundational muscle.

Chapter 2: The Jaw

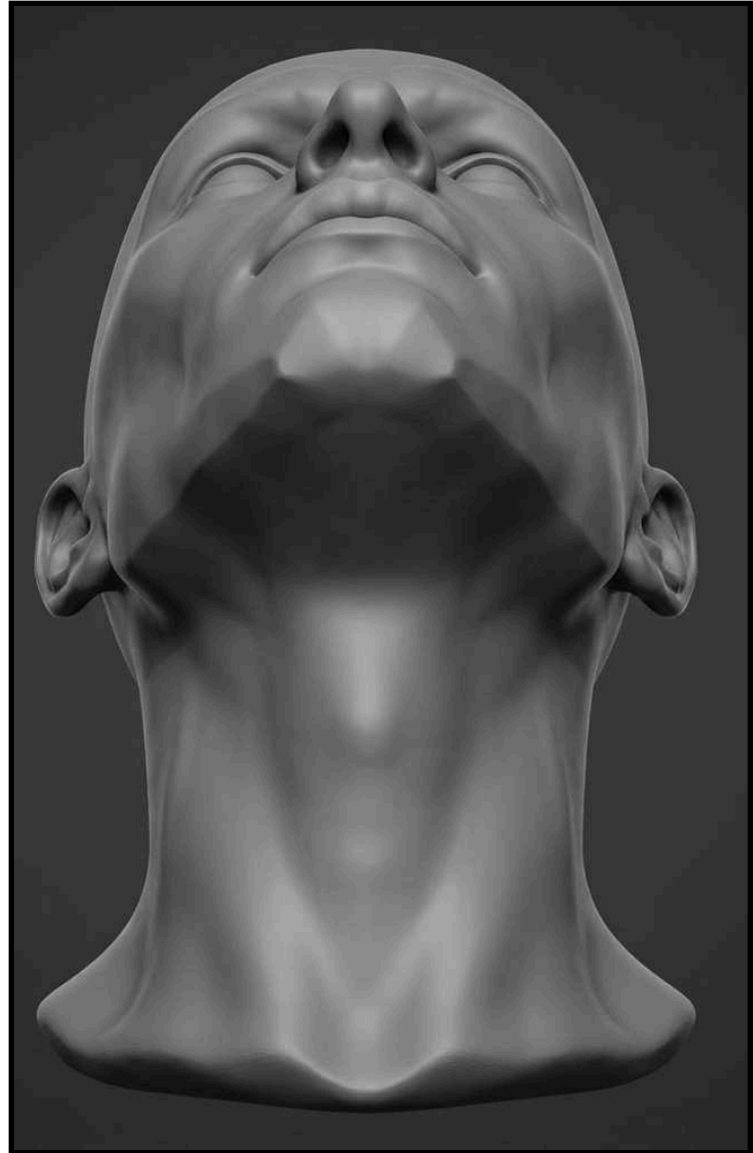

On Modifying the Jaw

The mission for our jawline is clear: to build a landmark.

We are architects of bone and muscle, working to push the jaw into a more assertive position.

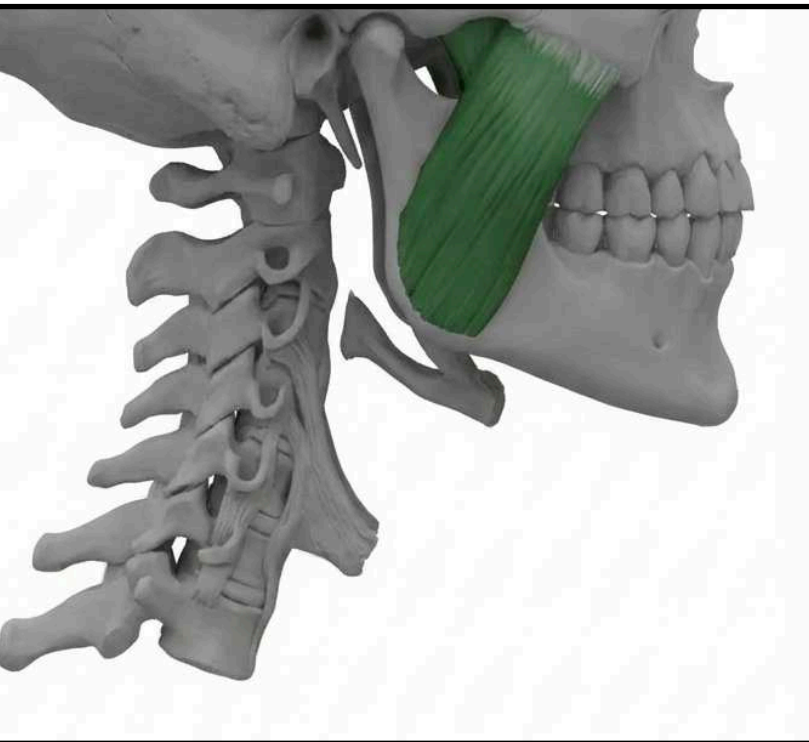

To forge a deeper, more masculine angle, and create a topography of shadow and light across the lower face.

This is about constructing an anchor for the entire face that conveys stability and strength.

Muscular Exercises

2.1 - Designing a powerful Jaw Line

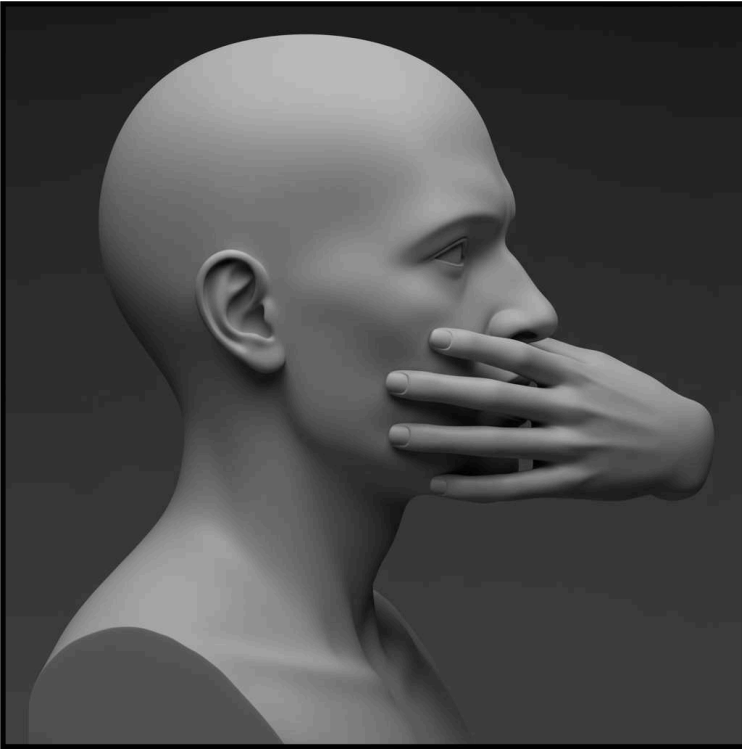

Medial Pterygoid

Function of the Medial Pterygoid:

A deep muscle that runs from the pterygoid plates of the sphenoid bone (inside your skull) down to

the inner angle of the mandible (lower jaw).

Isometric Grinding Hold

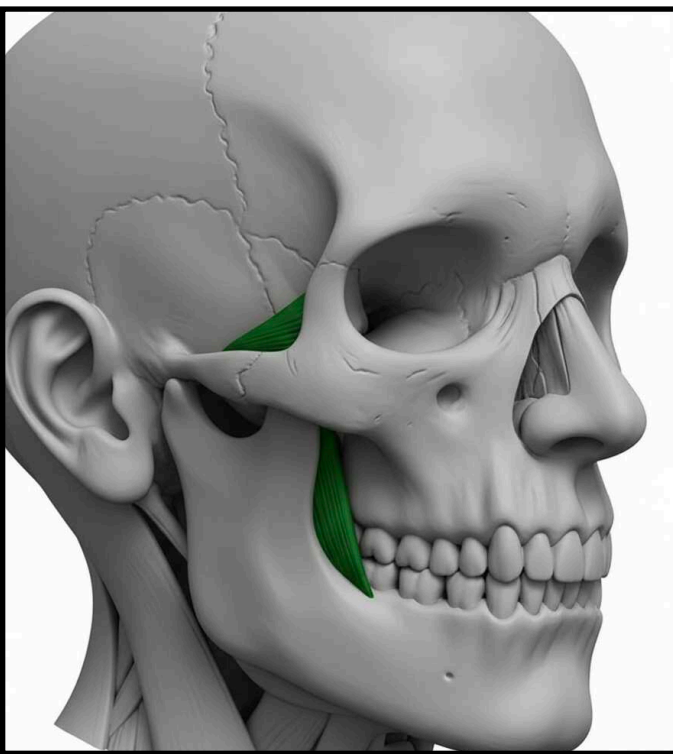

AS

Clench your teeth together normally. Now, slide your lower jaw slightly to the right (a few millimeters) using four fingers on the opposite side.

Keep your teeth in loose contact. Hold this clenched, shifted position for a few seconds. Then begin to “pump” these reps out. You will feel a powerful, deep engagement on whatever side of your jaw you are pushing towards.

X50

OPERATOR NOTES: REALLY CREATES A DEEP CUT UNDER THE JAW, VERY NICE.

Lateral Pterygoid

The Lateral Pterygoid is the most unique and critical jaw muscle for function, yet it is also the most delicate.

AS

Controlled Jaw Protrusion (Against Light Resistance)

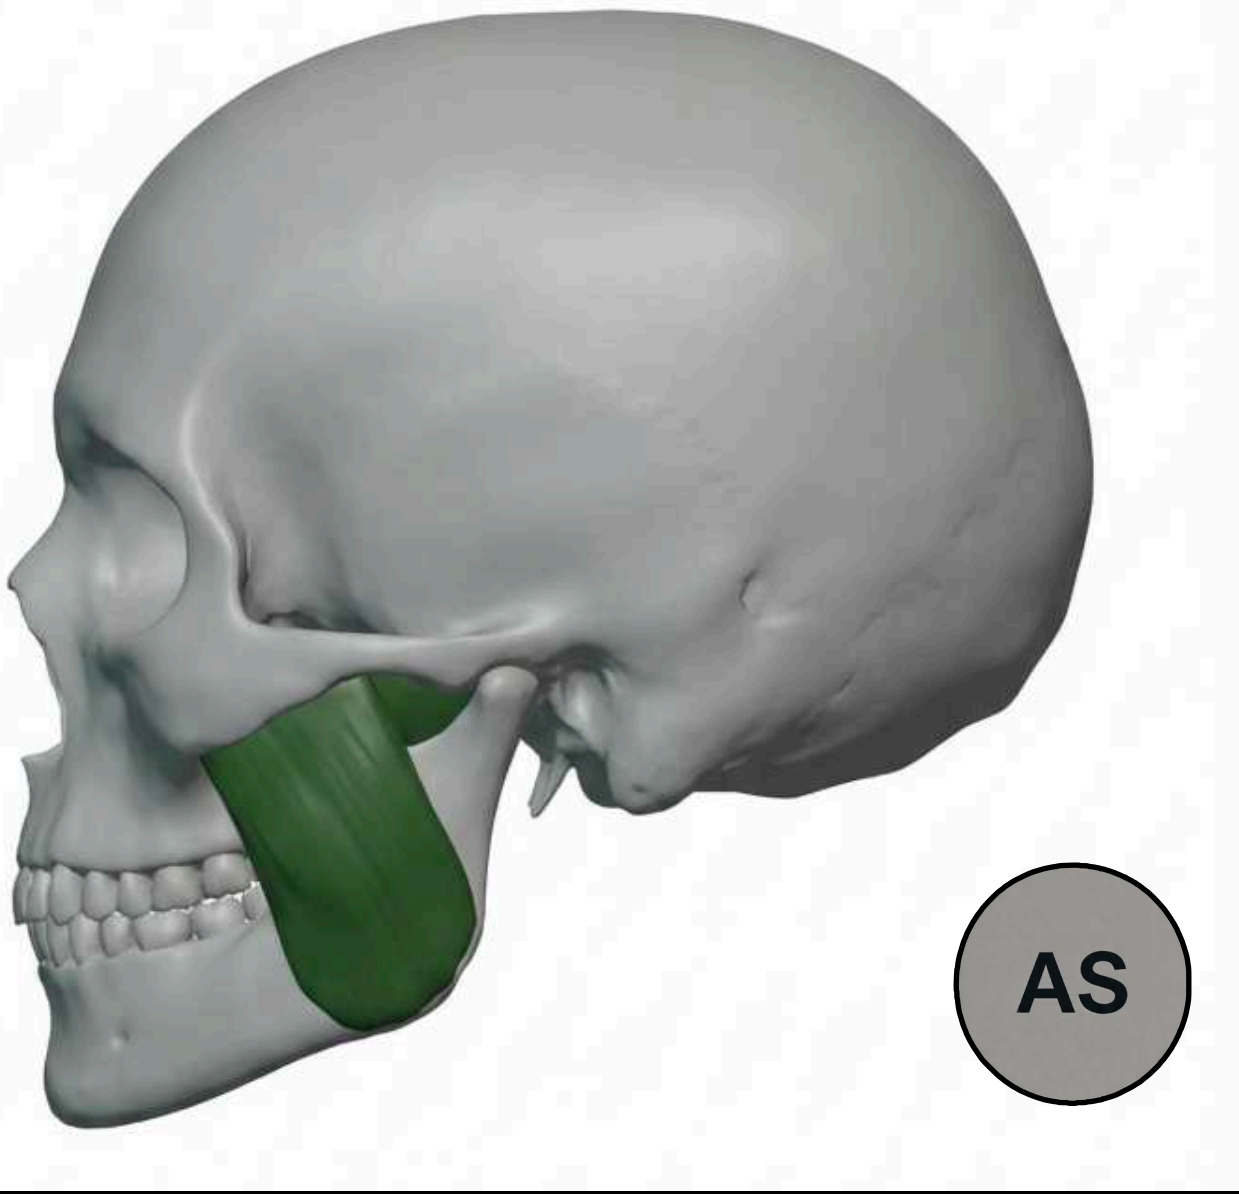

Place your thumbs under your chin, not quite the tip and the other two hands around the face near the Lateral Pterygoid muscle. Gently and slowly push your jaw forward (into an underbite position) against the light resistance of your thumb. Move only 3-5 millimeters.

X20 sets, as many as you'd like

Lateral Guidance (For Coordination)

Place your finger lightly against the sides of your chin.
Gently push your jaw sideways against your finger,
moving only 2-3mm.

X20 is fine

Masseter Muscle

Should do it occasionally to balance the face, makes the jawline even and helps raise the corner of the eyes.

Goal:

Strengthen without overloading. The Masseter is the strongest muscle in the face. Don't overwork too hard as you won't be able to chew properly later.

Resisted Jaw Clenching

Place palms under your chin with the thumbs hooked under the mandible, press down, but don't close the jaw all the way on the way back up. Do light, quick repetitions.

Do x20 times, x5 times. Rest.

OPERATOR NOTES: THIS MUSCLE WEARS OUT VERY QUICKLY AND ALL OF A SUDDEN AND CAN START TO "BURN." REST, RELAX A BIT AND THEN DO IT AGAIN. IT IS EXTREMELY OFTEN FOR ONE SIDE TO BE STRONGER THAN THE OTHER, THIS IS FROM CHEWING ON ONE SIDE CONSISTENTLY. PUSH DOWN MORE ON THAT SIDE, AT LEAST TWICE AS MUCH AND DO LESS ON THE STRONGER SIDE UNTIL YOU GET "BALANCE."

Resisted Jaw Push Up

Simply the reverse of the Resisted Jaw Clenching exercise. Place palms under your chin with the thumbs hooked under the mandible while *your jaw is open*, press up but don't let the jaw close.

2.3 - Creating a powerful chin

Mentalis

Probably the 5th most important exercise to do, doesn't matter if you think you have a big jaw already, mostly everyone (without medical conditions) should do this, as it helps set the entire face.

Goal:

Strengthen the muscle for to get a butt-chin, for women it makes the point all the more elegant and sharp.

Resisted Chin Puckering

Place your index finger lightly on your chin tip.

Pucker your chin upward (like a "pout") against the resistance.

Beginner: 30

Intermediate: 50

OPERATOR NOTES: VERY DIFFICULT TO DO, UTILIZE OIL ON FINGER TIPS TO AVOID "MICRO-TEARING" THE SKIN, BUT THE SLIPPERINESS MAKES IT DIFFICULT. IT'S A HARD MUSCLE TO "FEEL." YOU WON'T REALLY FEEL IT MOVING THAT MUCH.

Resisted Chin Push Down

Place palms on lower chin, push down with the mentalis only. You will "feel" it, it's a very strange sensation.

Beginner: 30

Intermediate: 50

Upper Lip Chin Pushup

Wrap lower lip over upper lip, almost touch nose. Go up and down.

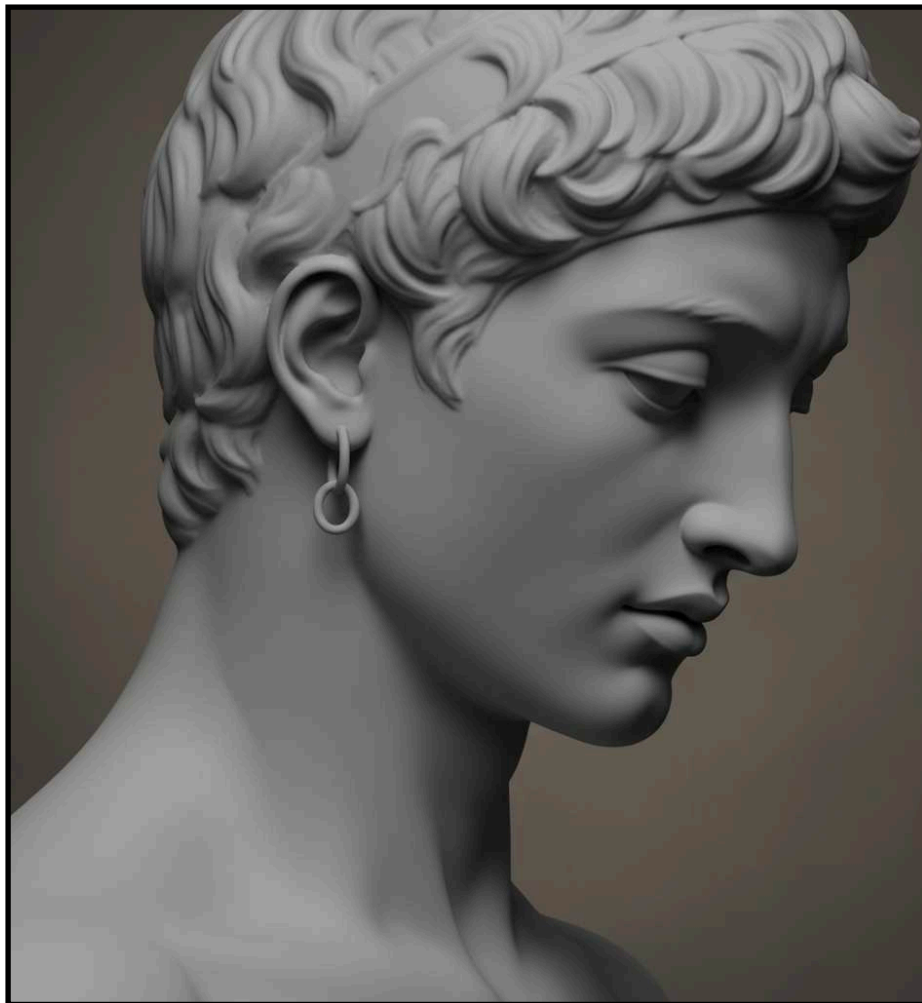

Beginner: 30

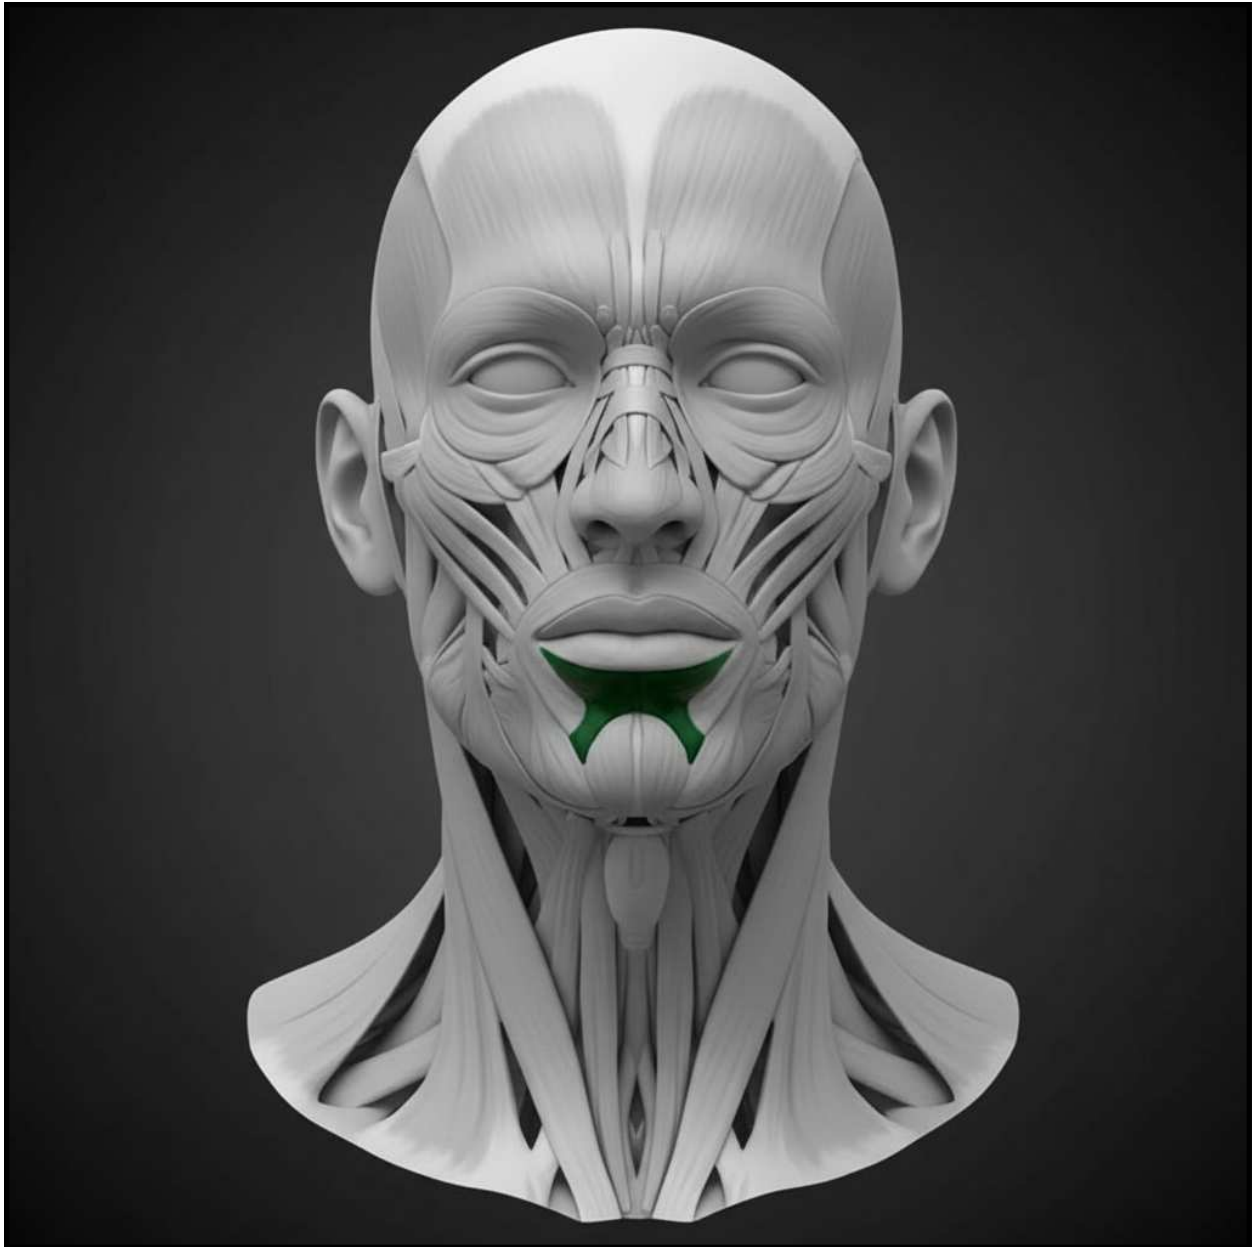

Intermediate: 50

Easier to do but less rewarding.

What This Does:

This is an idealized version of the “perfect male face”. Notice the jaw? Only a very, very, very strong mentalis can do this. That and genetics. This is the “ideal” jaw.

Depressor Anguli Oris

Function of the Depressor Anguli Oris (DAO)

Location: A triangular muscle that runs from the mandible (jawline) upward to insert at the modiolus (the muscular knot at the corner of the mouth).

- Action: Pulls the corner of the mouth downward and slightly lateral, creating expressions of sadness, disapproval, or a resting frown.
- Aging Impact: An overactive DAO contributes heavily to marionette lines (the downward creases from mouth to chin) and a perpetually "sad" or stern expression.

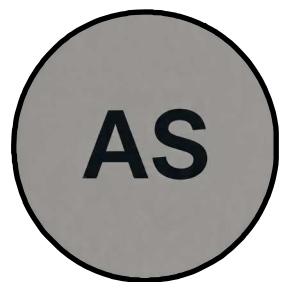

Resisted Frown (For Conscious Control & Symmetry)

Place your index fingers directly on the downward-sloping lines from your mouth corners to your jaw. Gently try to frown, pulling the corners of your mouth down against the resistance of your fingers. Resist as much as you can and add oil.

Beginner: x20

Intermediate: x40

Expert: x80

OPERATOR NOTES: PERSONALLY, ONE OF MY FAVORITE EXERCISES. DEFINITELY AS A GUY, YOU'LL WANT TO SHAVE FOR THIS ONE, THIS REALLY PROPS UP THE CHIN AND GIVES IT A "FULL LOOK" AS OPPOSED TO A SINGLE POINTED LOOK.

What This Does:

The "Smile Lift" Isometric

Place your index fingers on the corners of your mouth. Gently smile upward with your mouth closed, while using your fingers to press the corners downward. You can hold this isometric "tug-of-war" for 10 seconds. You are actively strengthening the Zygomaticus Major (the smile muscle) against the pull of the DAO.

X30

Asymmetry Correction

If one side of your mouth naturally rests lower, use a mirror. Practice activating only the DAO on the higher side to gently pull it down into symmetry with the lower side. Hold for 3 seconds, relax. Do 5 reps on the higher side only.

Key Training Principles

Focus on Release: For 90% of people, the DAO is chronically overactive. Your primary "exercise" should be massage and conscious relaxation. **Mind-Muscle Connection:** Learn what it feels like when the DAO is engaged (frowning) versus completely relaxed (neutral mouth). Your goal at rest is the latter.

Depressor Labii Inferioris Resisted Lower Lip Pull

Place your index finger (or several fingers as you get a stronger muscle) under your lower lip.

Gently press upward while trying to pull your lip downward against

the resistance.

X50

"Lower Teeth Exposure" Hold

Keep your upper lip relaxed. Pull only your lower lip downward (as if showing your lower teeth). You can hold for up to 5–10 seconds, then release.

X30 Beginner

Jaw Opening with Lip Control

Open your mouth slightly. Focus on isolating the lower lip (pull it down while keeping the upper lip still). Flex the Depressor Labii Inferioris, feel the muscle. Easy and quick exercise. Do as many reps as you feel comfortable to round off the sets of the Depressor Labii Inferioris workout.

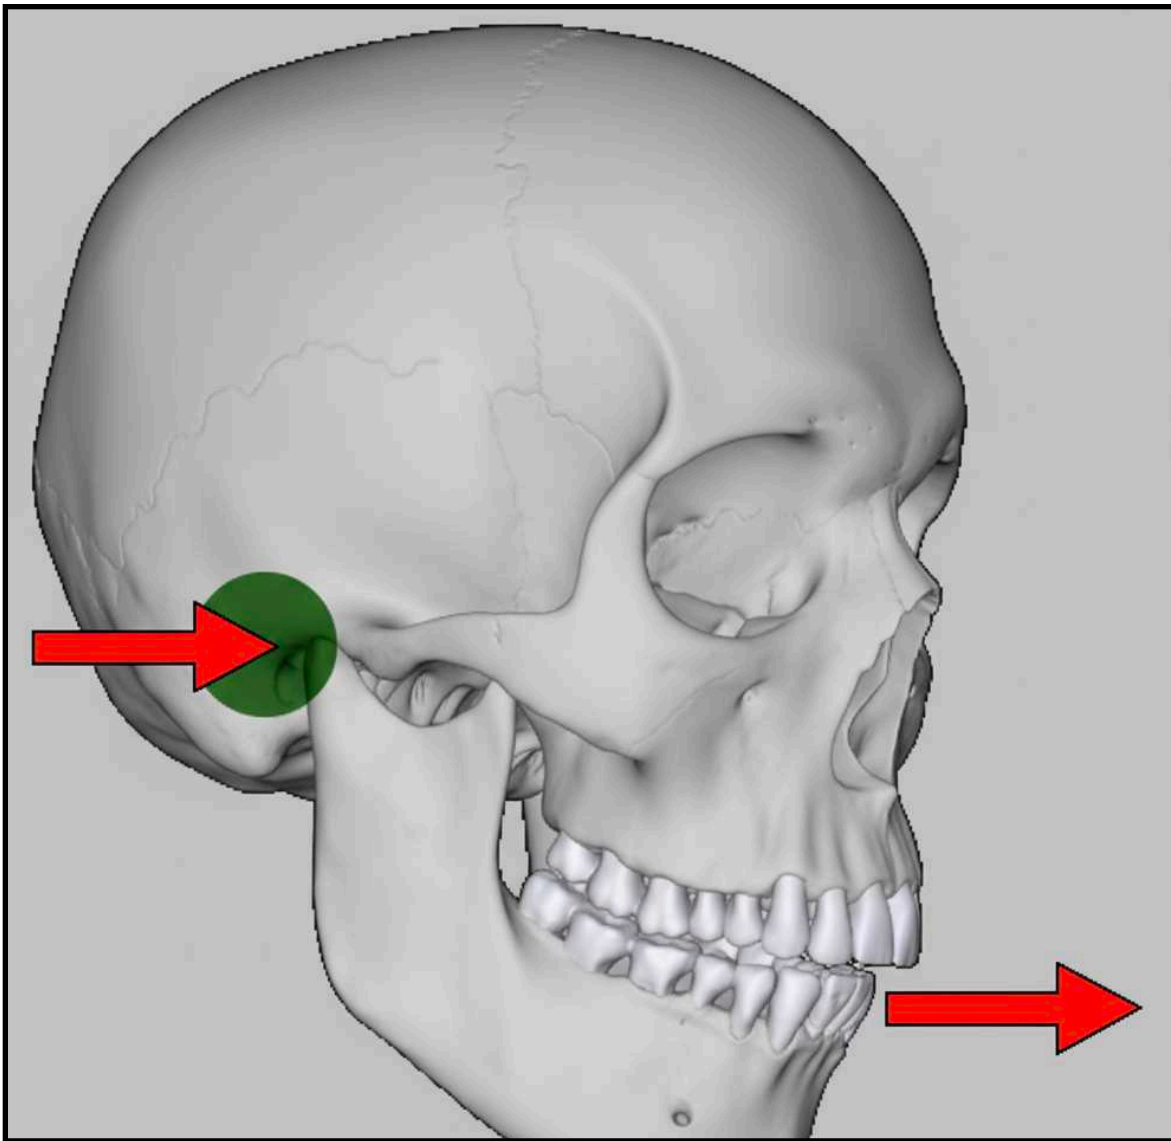

Massages

This massage sharpens the jaw line, just rub the jaw line between two knuckles.

X20 to X40 each side

Refinement

2.4 - Structuring the Jaw

Jaw Push Forward Technique

Goal:

Develop a forward jaw

Official Warning: Perform this exercise at your own risk. Excessive or improper force can cause ligament damage, joint displacement, or vascular complications. Individuals with any history of TMJ disorders, jaw surgery, facial fractures, or recent dental procedures must avoid this technique entirely. By proceeding, you assume full liability for any and all outcomes.

Not a beginner exercise! Get some practice under your belt before attempting (ideally minimum of 30 hours!)

Use oil on fingertips, press where the green point is at, where the jaw meets the skull, using fingers and moderate (to light) force. This will push forward the jaw and help “unlock” it over time, and can have permanent effect. Must be done many times. Push forward and down.

Beginner: 15 seconds, with moderate force

Intermediate: 30 seconds, with stronger force

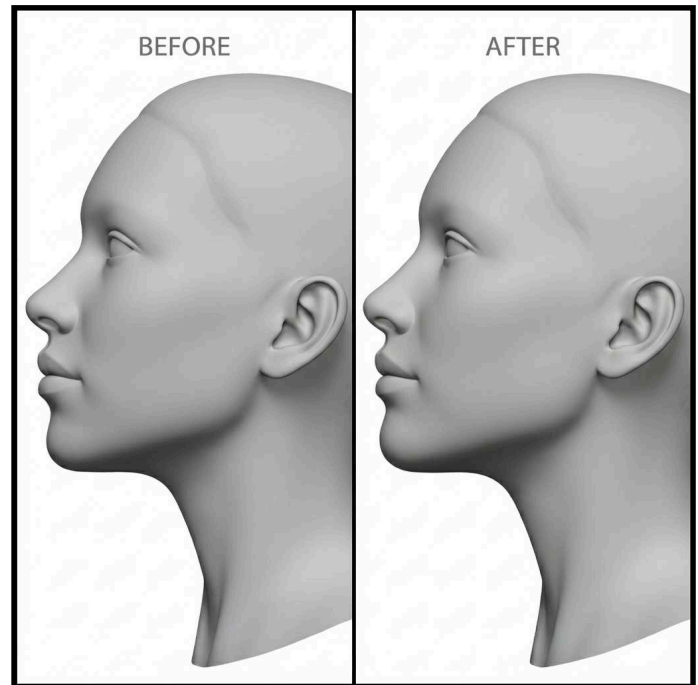

Expert: 60 seconds (with breaks)

Master: 100 seconds (with breaks)

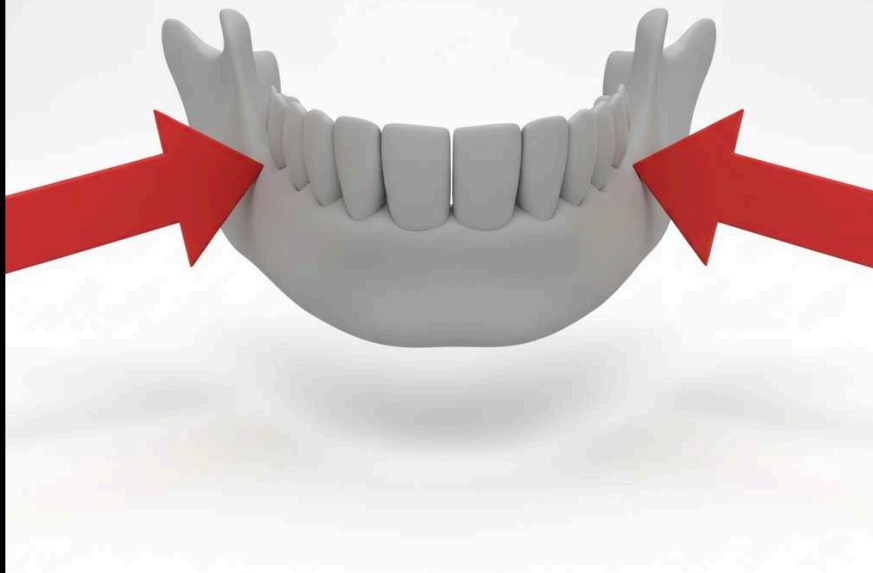

OPERATOR NOTES: - THIS ONE IS A TOTAL BANGER. FOR PROPER TECHNIQUE: THUMBS FACING DOWN, FINGERS ON TOP OF HEAD, SET ELBOWS ON DESK, PUSH UP WITH THUMBS THE ENTIRE SIDE OF THE FACE TO THE EYES FOR A MORE “CHAD” LOOK. THIS IS A VERY SUBTLE TECHNIQUE AND WILL TAKE A WHILE, DON’T FORCE IT. I HIGHLY RECOMMEND TAKING YOUR TIME, DON’T USE

ALL FORCE. AND YOU'LL WANT TO PUSH THE JAW IN ONE DIRECTION TO "RE-ORIENT IT", AFTER A BRIEF THIRTY TO SIXTY SECOND SESSION WITH BREAKS, YOU SHOULD SEE THE JAW STICK OUT MORE.

What This Does:

**FLARE OUT
THE MANDIBLE**

Mandible Flare Technique

Use seldomly for it can

be painful.

Official Warning: This is an extreme structural manipulation. Excessive force can fracture the mandible, dislocate the temporomandibular joint (TMJ), or cause permanent nerve damage. Individuals with any history of jaw surgery, facial fractures, osteoporosis, TMJ dysfunction, or connective tissue disorders must avoid this technique completely. By proceeding, you accept full and sole responsibility for any injury or adverse outcome.

Goal:

Flare out the mandible 120 degrees.

Use this with caution. But you can do it. Oil on thumbs, press where the mandible is, using your thumbs and “hook” under the jaw, press it forward to press forward the mandible. You can use your hands on the sides of your head to get more “force” and even set the elbows on the desk and push. Helps to close the eyes. Do not clench the jaw. **Your jaw is probably uneven, so do it more one side if it feels uneven.**

Beginner: 15 seconds, with light force

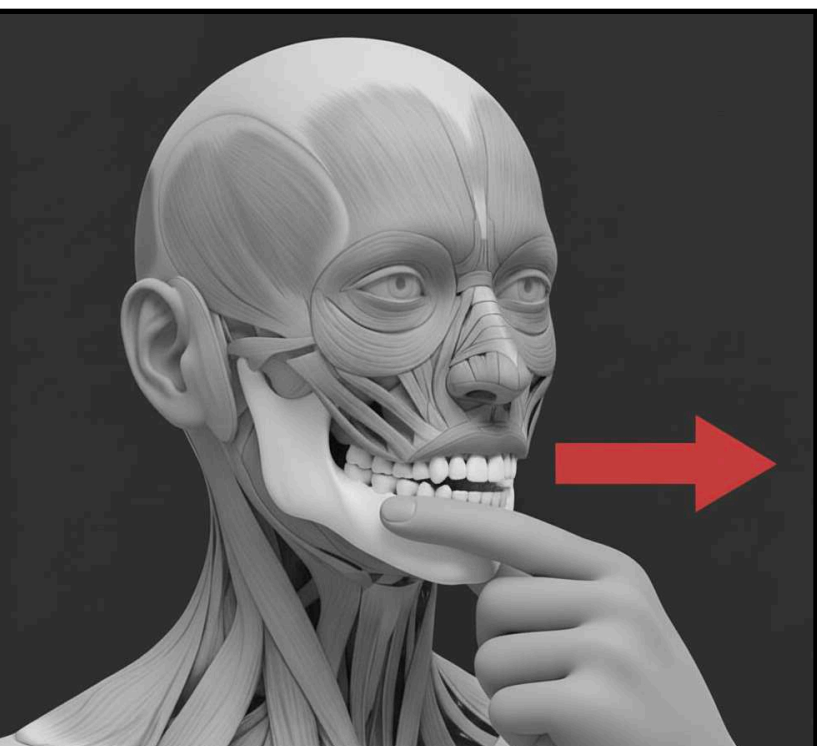

Intermediate: 20 seconds, with moderate force

Expert: 60 seconds

OPERATOR NOTES: THIS ONE ACTUALLY HURTS, AND IT SHOULD HURT A LITTLE. DO NOT GO TOO HARD. THE PAIN SHOULD BE A SOLID 3/10 TO 4/10. THIS WILL WORK, OVER TIME AND MAY TAKE YEARS ACTUALLY. BUT IT WILL FLARE OUT THE JAW.

What This Does:

You can see the jawbone is kind of “flared out here”, meaning it’s visible from the front in direct eyesight.

Jaw Point Technique

Official Warning: This is not orthodontics. Manual jaw repositioning risks permanent joint damage, dental misalignment, malocclusion, and chronic facial pain. Individuals with braces, retainers, crowns, implants, jaw surgery history, or TMJ issues must avoid this exercise entirely. You are attempting to alter your skeletal structure; proceed at your own peril and accept all consequences.

Goal:

Fix teeth alignment from the outside and create a “powerful” jaw.

Use oil and with two thumbs, grab under the jaw and push it forward. Stretch it, use moderate force. You can place your elbows on the desk. This will help stretch the jaw forward and even can fix teeth placement.

Beginner: 30 seconds, with light force

Intermediate: 60 seconds

Expert: 100 seconds, heavier force

OPERATOR NOTES: MOST PEOPLE’S JAWS ARE UNEVEN FROM EATING FOOD ON ONE SIDE, THIS WILL HELP CORRECT IT. IF YOU FEEL YOUR JAW IS “UNEVEN”, PUT MORE PRESSURE OR JUST PRESSURE ON THAT SIDE. WILL HAVE ALMOST IMMEDIATE EFFECTS.

What This Does:

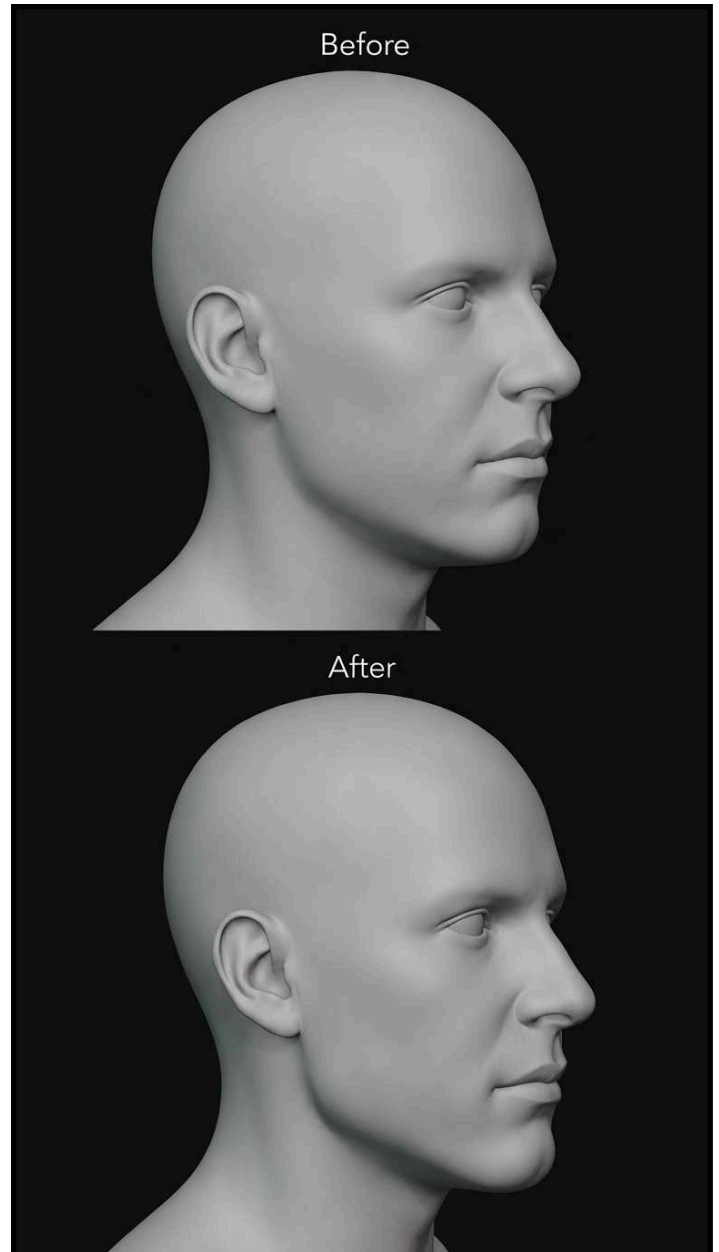

2.5 - The Butt-Jaw Connection

OPERATOR NOTES: BASICALLY, IF YOU SIT DOWN TOO LONG, YOUR JAW WILL GET TOO TIGHT, LEADING TO A RECESSED JAW AND WEAK FACE GROWTH.

Primary Muscle:

Hamstrings (Biceps Femoris
- Long Head).

This is the large muscle group on the back of your thigh. When you stand and flex the back of your leg, you are primarily engaging the hamstrings. The long head of the

biceps femoris originates from the ischial tuberosity (the "sit bone" deep in your lower buttock). Its thick, powerful tendon is exactly what you feel tensing in that crease.

Secondary / Overlapping Muscle: Lower Gluteus Maximus.

The gluteus maximus (your largest buttock muscle) inserts into a thick tendon called the iliotibial (IT) band and also into the gluteal tuberosity of the femur.

Its lowermost fibers interweave and overlap with the upper hamstring tendons in that junctional crease. When you squeeze hard, you are co-contracting the lower glutes with the upper hamstrings.

Why This Matters For Your Jaw:

A tight, weak, or dysfunctional hamstring origin (especially the biceps femoris) is a primary driver of posterior pelvic tilt (tucking the tailbone under). This flattens the lumbar spine, which then forces the upper back and neck to curve forward to compensate, leading to forward head posture and jaw clenching. By learning to

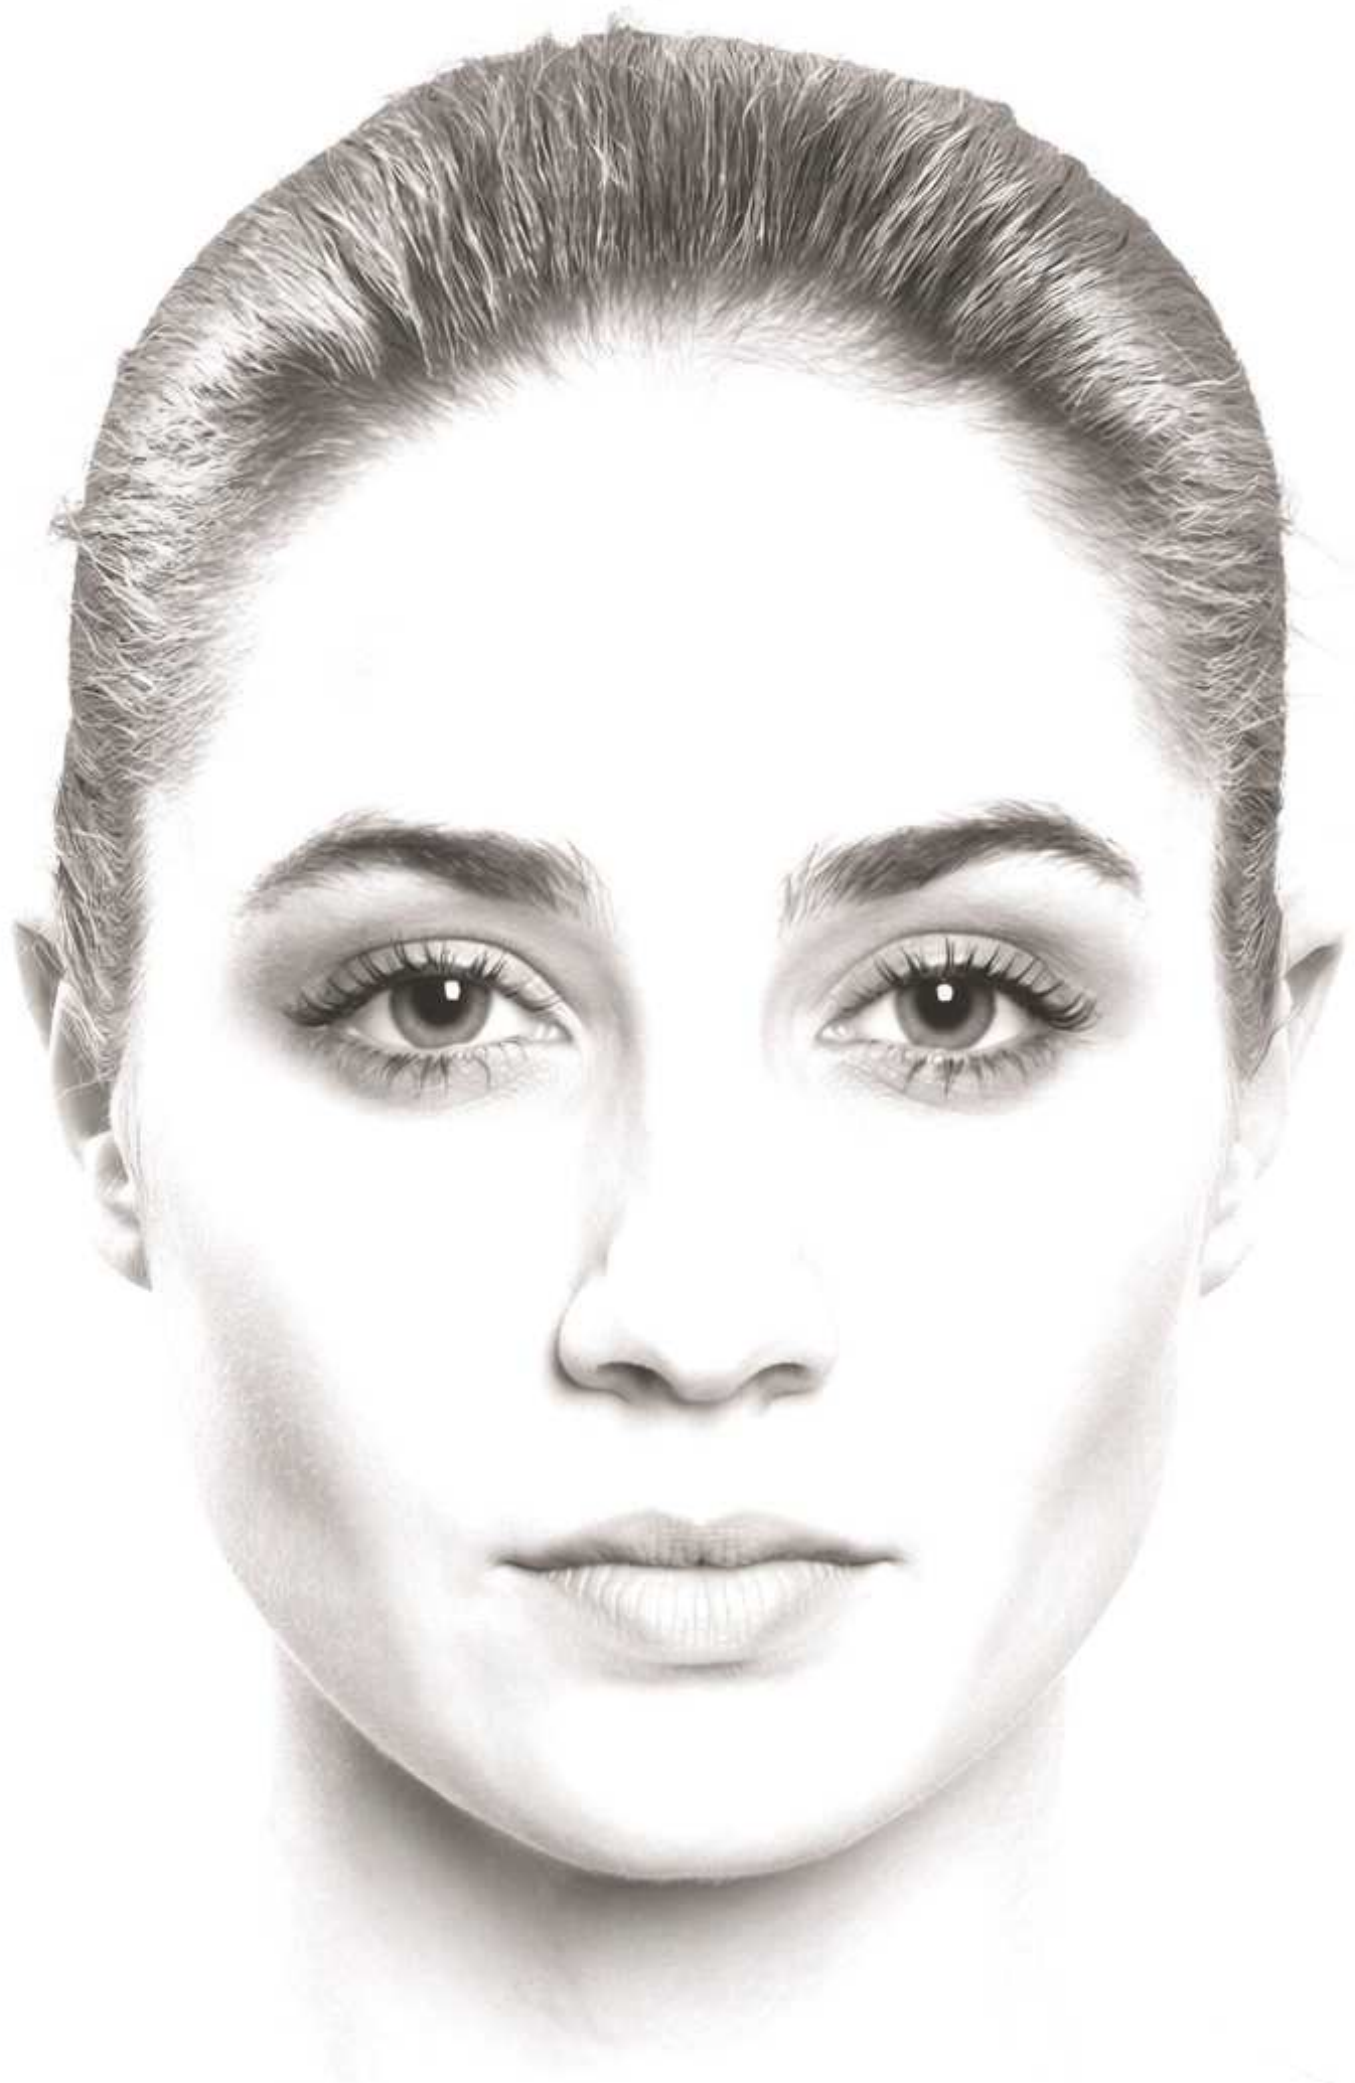

engage and then properly release this specific junction, you can begin to correct your pelvic position, which is the first and most critical step in unwinding tension all the way up to your jaw.

Simple Test:

Stand and try to isolate that flex. Now, while maintaining it, try to relax your jaw completely. You'll likely find it very difficult—a direct demonstration of the kinetic chain link.

The Glute Tension Cable Pull:

Let's relax the jaw and neck, with our butt. Stand up straight, look at the outside of your butt cheeks (helps to be in front of a mirror) and flex the outside of those cheeks into our hips, this will unclench the jaw, go for forty reps.

The Lips of Signal: Nature's Billboard

Health Billboard: Full, flushed lips signaled strong circulation and fitness.

Strength Check: Strong oral muscles meant you could eat tough foods—a direct sign of resilience.

Social Tool: Precise lips allowed clear communication and bonding, key for the tribe.

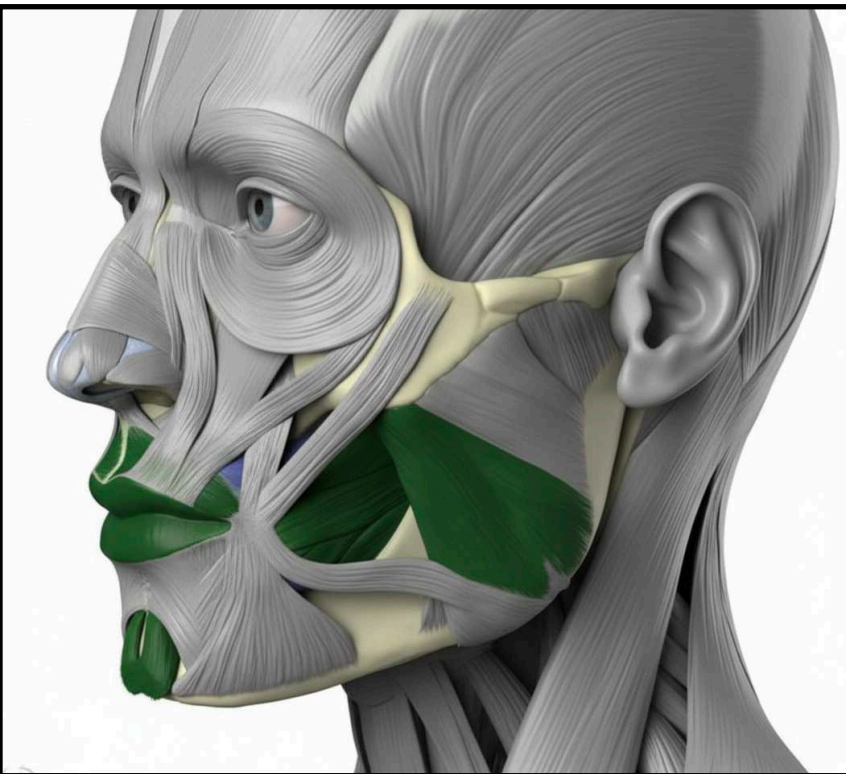

Sensory Alert: Dense nerves helped test food safety, a frontline survival skill.

Muscular Exercises

Chapter 3 - The Lips

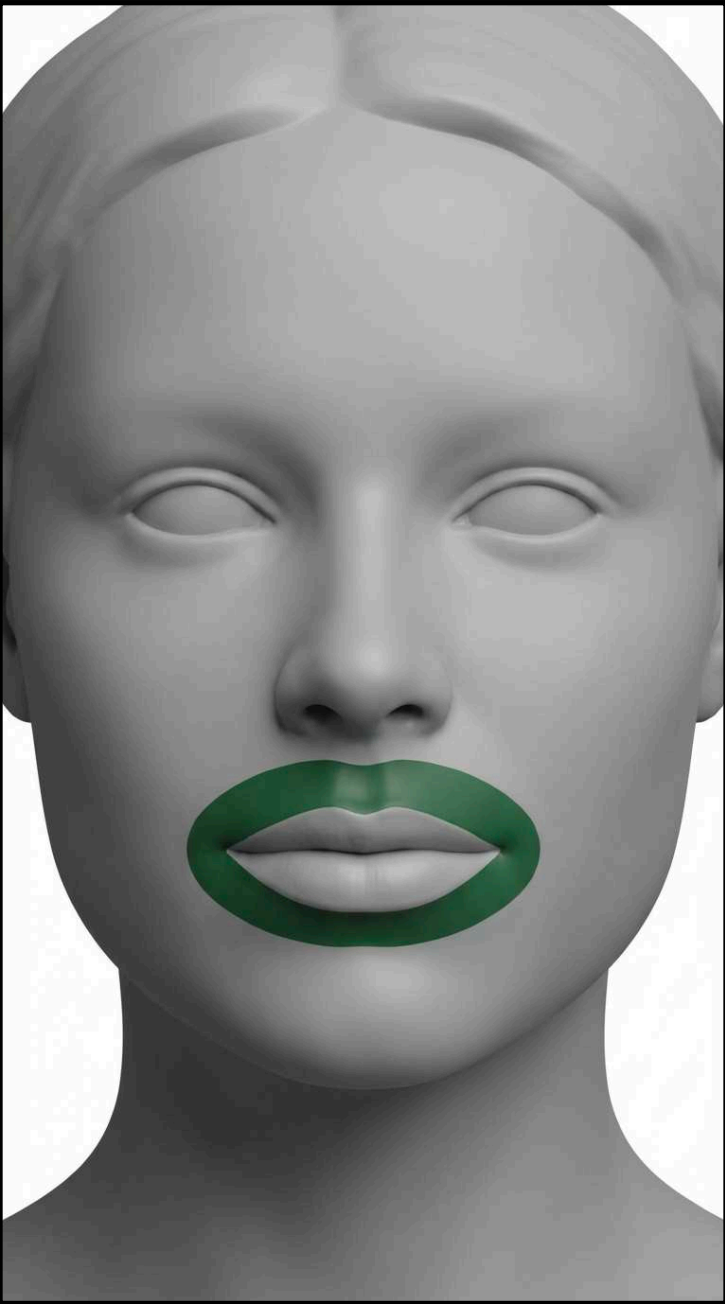

Concepts:

The lips are not cartilage, which means massages aren't totally effective, but as mucosal membranes and muscles, they can be trained. Which means we need to use a combination of muscle work and massages to make them bigger and more full.

The muscles of the lips are the following;
Orbicularis Oris,
Modiolus, Buccinator and the Risorius although also highlighted here is the Mentalis and the Medial Pterygoid.

Orbicularis Oris

Importance - Do not skip this exercise, it's one of the most important.

(Primary Lip Muscle)

Location: Encircles the mouth (like a purse-string).

Function:

Closes / purses lips (kissing, whistling). Protrudes lips (pouting). Unique Feature: Embedded directly in the lips, blending with surrounding muscles.

Goal: Improve lip strength, tone, and mobility.

Lip Press

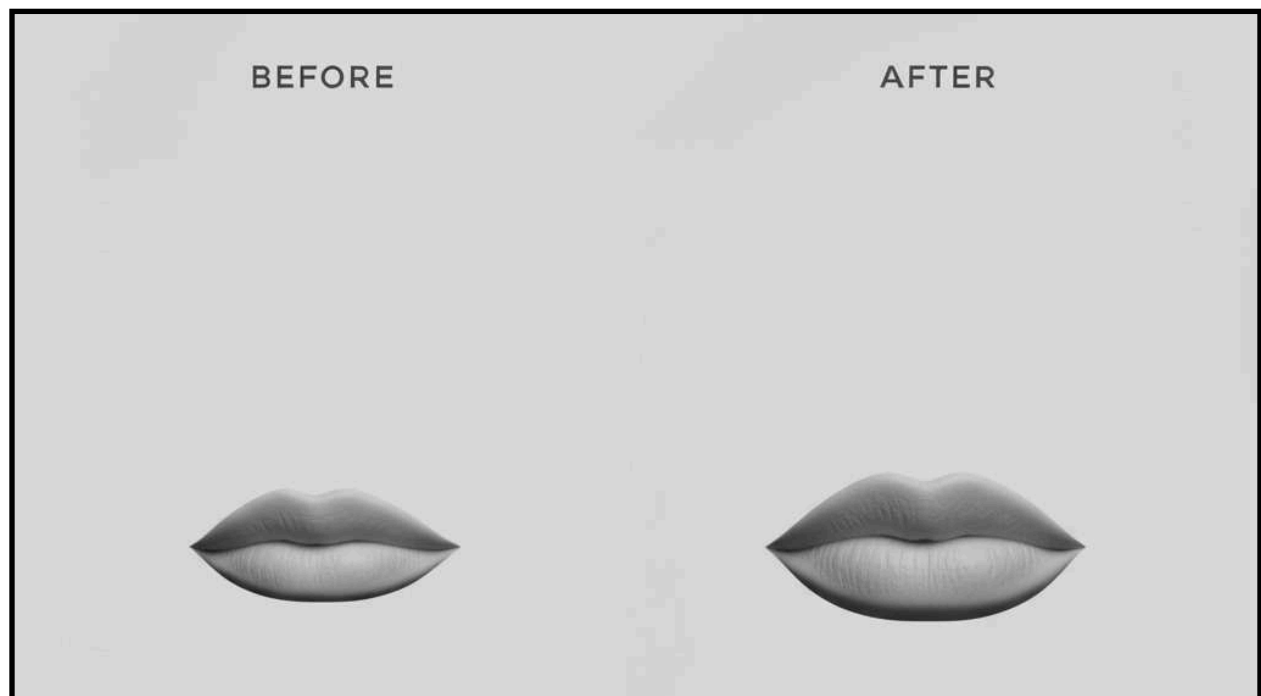

Purse lips tightly (like a kiss). Use oil on your palm (or fingers) and change palms throughout. Press against the palms or fingers, pushing forward. *You have to use oil* since it will stretch the lips or even crack them without oil.

Beginner: 40, twenty times with each palm

Intermediate: 80

OPERATOR NOTES: DON'T BE AFRAID TO GO "SUPER-HARD" ON THIS WORKOUT. YOU CAN OVERWORK THIS MUSCLE. IF YOU FEEL YOU CAN DO MORE, DO MORE. BUT IT MAY BE A BIT HARDER TO CHEW LATER ON. THIS MUSCLE DOES NOT MAKE YOUR LIPS BIGGER, IT MAKES THEM "POUT OR STICK-OUT MORE". WHAT IT DOES FOR YOUR FACE IS GREAT, IT GIVES A MUCH MORE ANGLED FACE, PUSHING UP THE CHEEKS AND HELPS RELAX THE LOWER FACE.

What This Does:

Lip Press-In

Simply reverse the process. Purse lips tightly (like a kiss) and press forward. Use oil on your palm (or fingers) and change palms throughout. Press against the lips and *push in, resist as hard as you can for about ten seconds.*

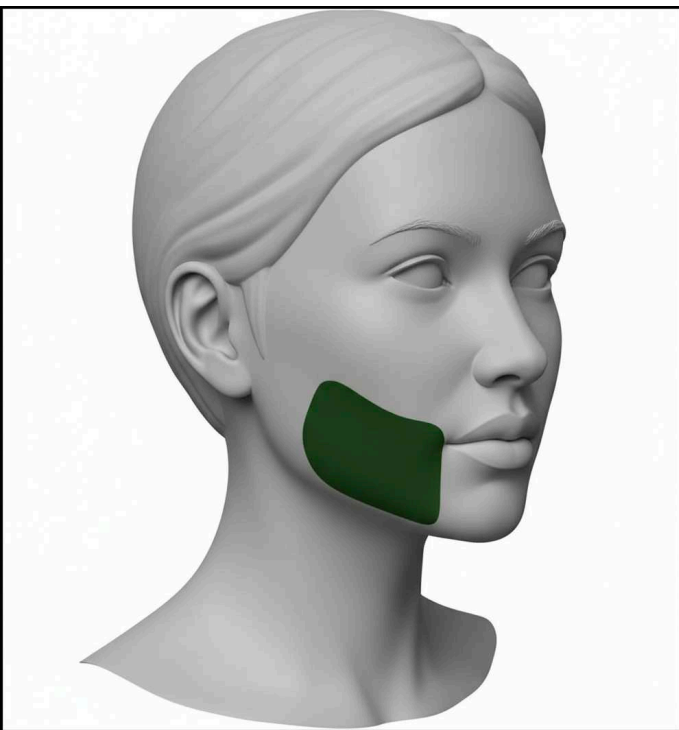

X5 is fine

X10 as you get more comfortable

OPERATOR NOTES: HELPS THE LIPS SET-IN MORE AND WORKS THE OPPOSITE MUSCLES WHERE THE MUSCLE ATTACHES TO THE LIPS THEMSELVES.

Modiolus

The modiolus is not a traditional muscle you can contract in isolation. It's a dense, fibromuscular knot where several facial muscles converge near the corners of the mouth.

Therefore, you cannot "work out" the modiolus directly. Instead, you train and strengthen the muscles that insert into it to improve its stability, symmetry, and control. This is about refining the complex movements of smiling, speaking, and expression.

Corner Pull Isometrics (For Stability & Symmetry)

Place your index fingers directly on the corners of your mouth. Smile widely against the resistance of your fingers, focusing on pulling the corners straight back (lateral pull from the Risorius and Buccinator).

X50

OPERATOR NOTES: REALLY HELPS PLUMP UP THE LIPS.

The "One-Sided" Smile (For Asymmetry Correction)

If one corner of your mouth is weaker or lower, this isolates the muscles on that side. In a mirror, attempt to

smile using only one side of your face. Keep the other side completely relaxed. Use a finger to gently assist or guide the weaker corner if needed.

- **Symmetry is the Goal:** Use a mirror constantly. The modiolus should be a point of balanced tension, not a source of pull to one side.
- **Relaxation is Crucial:** After exercises, massage the modiolus area (the corners of your mouth) in small circles to release any built-up tension and prevent a perpetually tense or "snarling" resting expression.
- **Why This Matters:** A well-trained, balanced modiolus is the secret to a genuine, symmetrical, and confident smile. It prevents mouth corner drooping (marionette lines), ensures clear speech articulation, and is the cornerstone of expressive facial control.

Buccinator

Not overly important and usually not underworked compared to most muscles (since we suck from straws a lot), but nice to do.

Cheek Hollowing ("Fish Face")

Place your palms or fingertips firmly against your cheeks.

Suck your cheeks in slightly. Pucker your lips outward into a tight "kissy face," while simultaneously pushing your chin upward into a hard pout. Now, perform the core

movement: while maintaining the pout and cheek tension, force your lower lip straight upward against the resistance, as if trying to curl your lip toward your nose. You should feel a strong contraction in your chin and along your jawline.

Beginner: 40

Master: Up to 100

OPERATOR NOTES: THIS EXERCISE DOES NOT DIRECTLY CREATE A HOLLOW-CHEEK APPEARANCE, NOR DOES IT INDUCE IMMEDIATE MUSCLE FATIGUE. INSTEAD, IT STRATEGICALLY STRENGTHENS THE MUSCULAR FRAMEWORK SURROUNDING THE MOUTH. BY DEVELOPING THE ORBICULARIS ORIS COMPLEX AND ITS SUPPORTING MUSCLES, YOU ENHANCE THE FORWARD PROJECTION AND DEFINITION OF THE ENTIRE PERIORAL AREA. THIS CREATES A HEALTHIER, MORE SUPPORTED FULLNESS IN THE LOWER FACE—A STRUCTURAL IMPROVEMENT THAT CONTRASTS WITH THE GAUNT, "ZOMBIE-LIKE" LOOK THAT CAN RESULT FROM SURGICALLY REMOVING THE BUCCAL FAT PADS.

Guided Buccinator Press

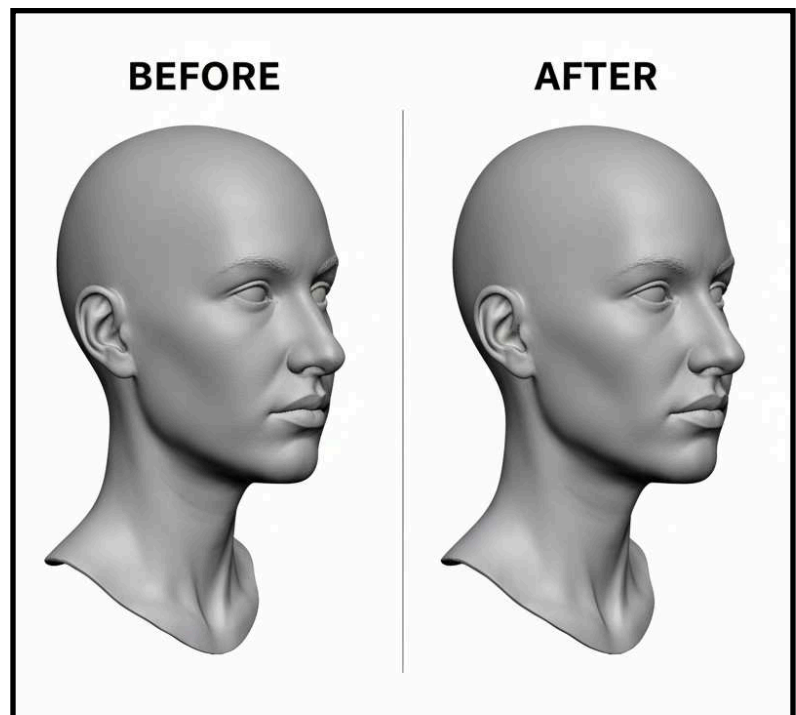

Place your palms vertically against the sides of your face, just beside the mouth. Press your palms gently forward, which will push your lips into a puckered position. Keep your lips actively engaged in this "kissy" pose, then slowly release the hand pressure while maintaining the lip tension, allowing your lips to return to neutral without collapsing. This serves as a cooldown exercise to reinforce

muscular coordination and maintain buccinator engagement as you transition to the next part of your routine.

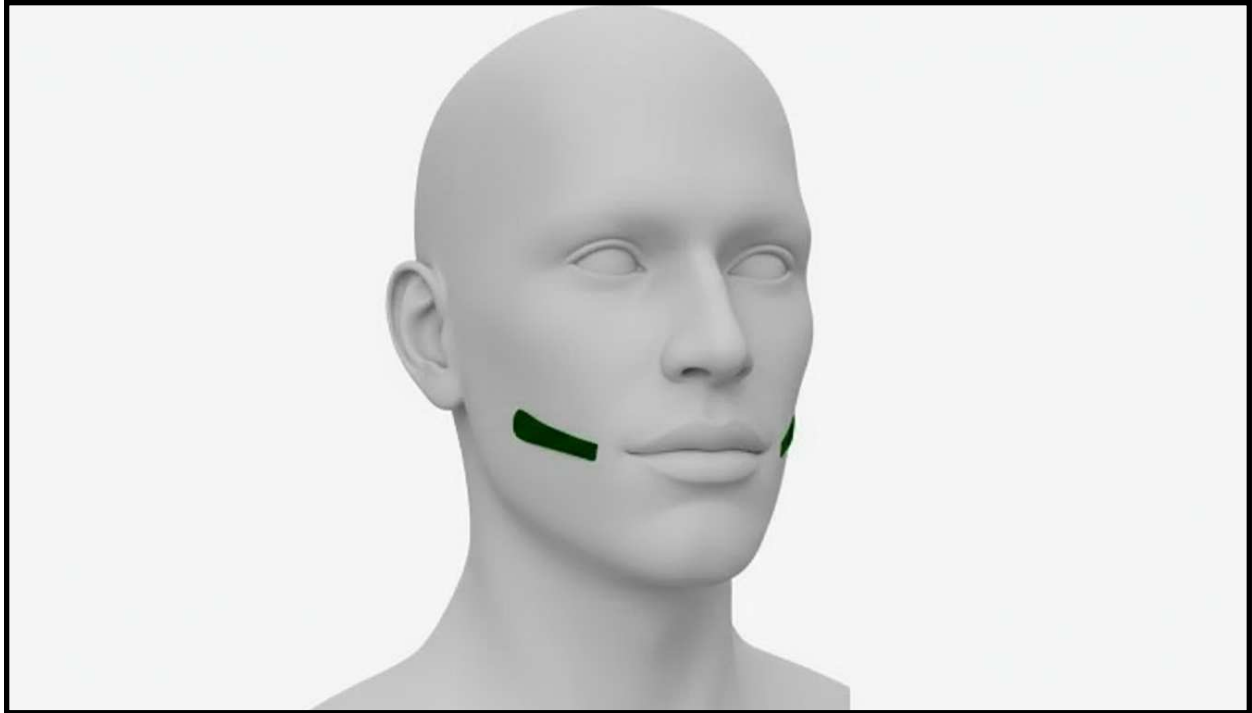

Beginner: 40

Master: Up to 100

*What This
Does:*

Risorius

An absolute must for the perfect “hollow” cheek look that most international models have. Necessary to do. To target the risorius muscle—the slender muscle responsible for pulling the corners of your mouth sideways in a grin or tense smile—you’ll need focused exercises that emphasize lateral mouth movement. Here’s how to strengthen or relax it, depending on your goals:

Resisted Sideways Smile

Place three fingers at the corners of your mouth. Stretch lips into a wide, tense grin (like a "Joker smile") while resisting with your fingers. If you don't feel it enough, use the back of your wrists for added pressure, don't be afraid to overwork and go very hard. *Make sure to use oil on your fingers or wrists as this can cause little tears if your skin is dry.*

Beginner: 50

Intermediate: 100

Expert: 150

OPERATOR NOTES: IF YOU NOTICE ONE SIDE OF YOUR MOUTH HAVING THE FINGERS SLIDE OFF, IT'S BECAUSE THAT SIDE IS WEAKER, FOCUS ON DOING THAT SIDE FOR 10 TO 20 REPS ALONE. YOU CAN AND SHOULD GO VERY HARD ON THIS MUSCLE. IT CAN TAKE QUITE A BEATING AND WON'T FEEL TIRED FOR A LONG TIME, BUT IT IS VERY POWERFUL. YOU SHOULD NOTICE AN IMMEDIATE EFFECT IN THE MIRROR.

Reverse Resisted Sideways Smile

Goal: Get Hollow Cheeks

Press mouth forward. Place three fingers at the corners of your mouth on each side. Try to pull the mouth back regularly against the resistance of the fingers. This exercise

is much harder, go softly. Put oil on your lips (almond, soybean based, any type of facial oil) as it will stretch your lips. You should feel tension at the corner of your lips.

Beginner: 50 - No need to do more, your lips should be totally exhausted by now

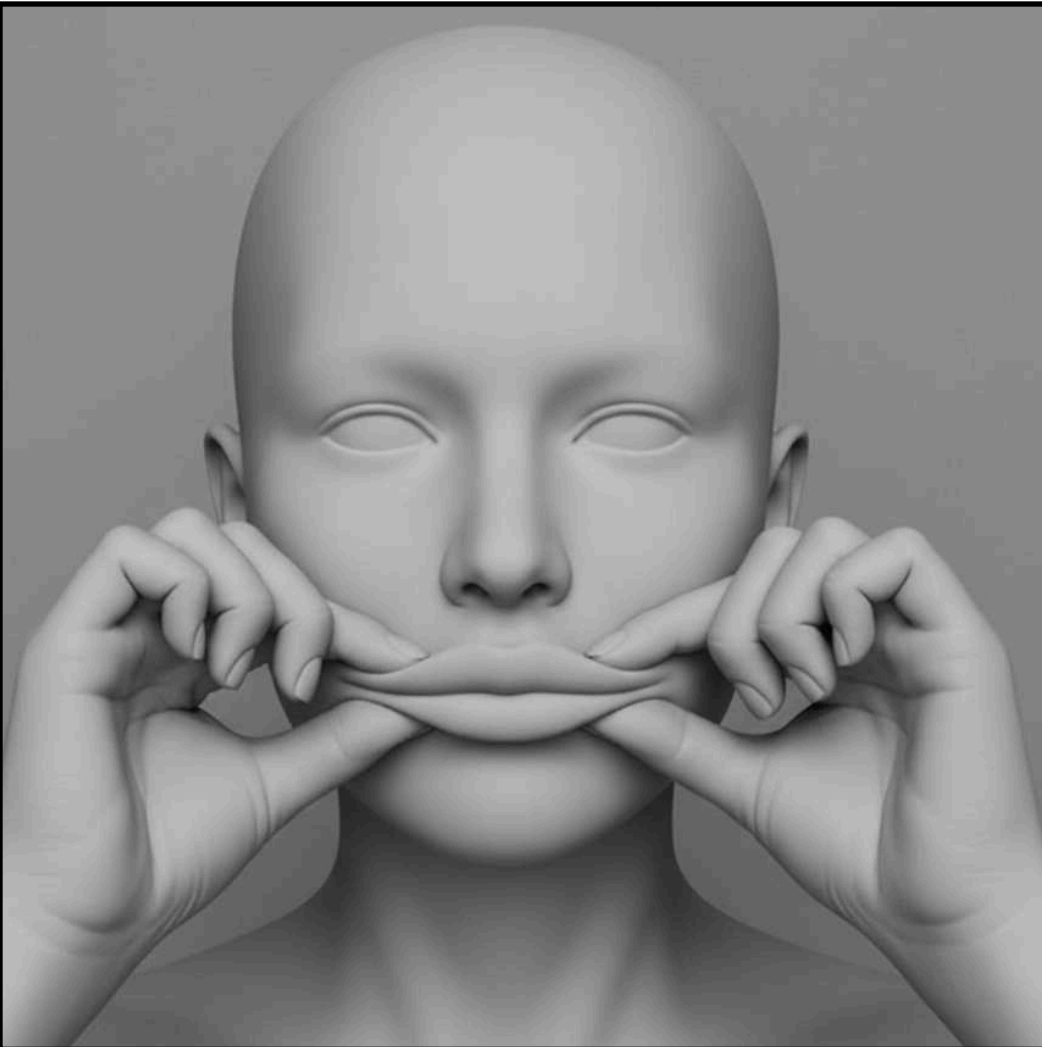

OPERATOR NOTES: THIS WILL GIVE YOU VERY PLUMP, JUICY LIPS. IT WORKS IMMEDIATELY. THIS IS PERHAPS THE BEST LIP EXERCISE.

What This Does:

Massages

Do each massage for up to 100 seconds

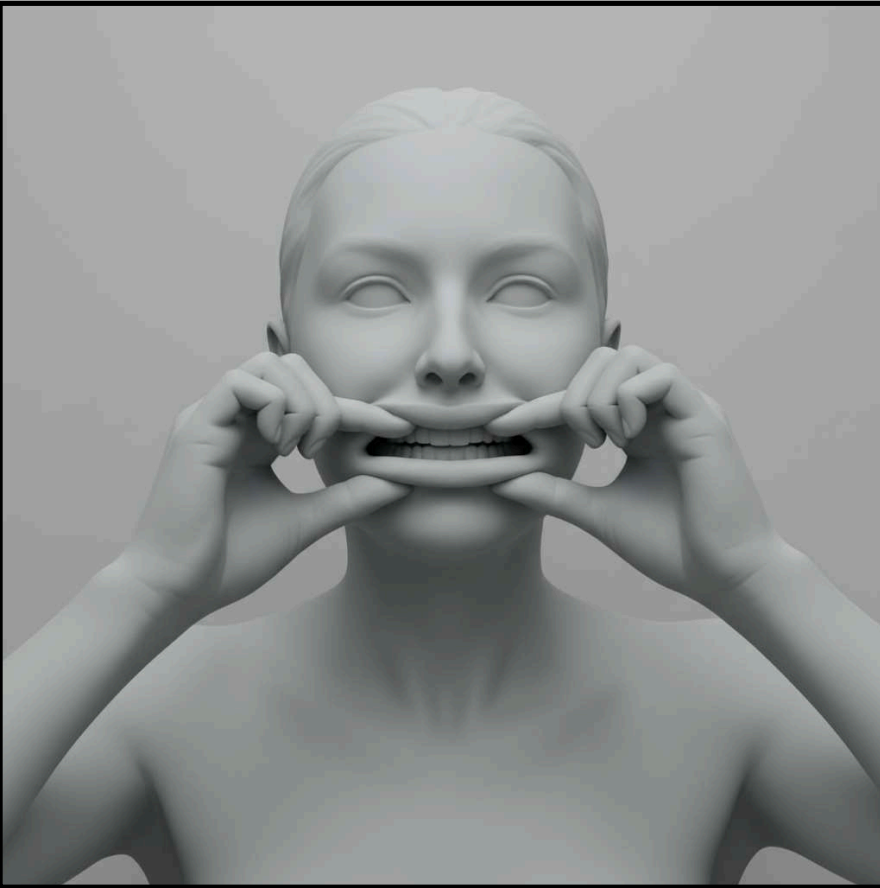

Lip Squeeze and Pull

Takes a while to work, changes are noticeable right away but won't last long. Will have to do this many times for noticeable effects.

You MUST use

oil (on both hands - and the lips) as you will stretch the lips and create cracks. Grab with fingers on each side, and pull the lips forward and to the side. Then use your hands

to pull individual lips forward at each point of the lip, both bottom and top.

Lip Squeeze and Pull Apart

Use oil, squeeze lips and push forward until the lip slips past your fingers. You can dig your fingers slightly into your mouth and press on the lips and push them forward and

out as well, act like a dentist trying to see the inner lip and push it out, squeeze all along the lip as you pull it out.

Lip Pull

Keep your fingers entirely outside your mouth. Spread your lips out - like so in the picture, then use your fingers

to run along and spread out the lip tissue outwards. The whole point is to “widen” the lip tissue with gentle force. This massage needs the most oil out of any other, as it cracks the lips as you pull them apart.

OPERATOR NOTES: TO BE FAIR, NOTHING WILL REALLY MAKE YOUR LIPS “BIGGER”, THE LIPS ARE THEIR OWN DISTINCT, TRANSITIONAL TISSUE—A THIN, NON-KERATINIZED, NON-GLANDULAR, AND HIGHLY VASCULAR MEMBRANE THAT GIVES LIPS THEIR CHARACTERISTIC COLOR AND SENSITIVITY. THE INSIDE OF YOUR LIPS (LABIAL MUCOSA) IS THE SAME TYPE OF TISSUE AS THE INSIDE OF YOUR CHEEKS, WHICH IS RELATED TO THE MUCOSAL LINING. THEY’RE HIGHLY SIMILAR TO THE VESSELS FOUND IN THE GENITALIA, SO ALL YOU CAN REALLY DO IS STRETCH THE TISSUE PART AND PRESS THE VESSEL PART TO GET MORE BLOOD FLOW IN.

Refinement: None

The Primal Gaze

Today, we've over-trained our eyes for screens and let the muscles for wide vision and steady focus weaken.

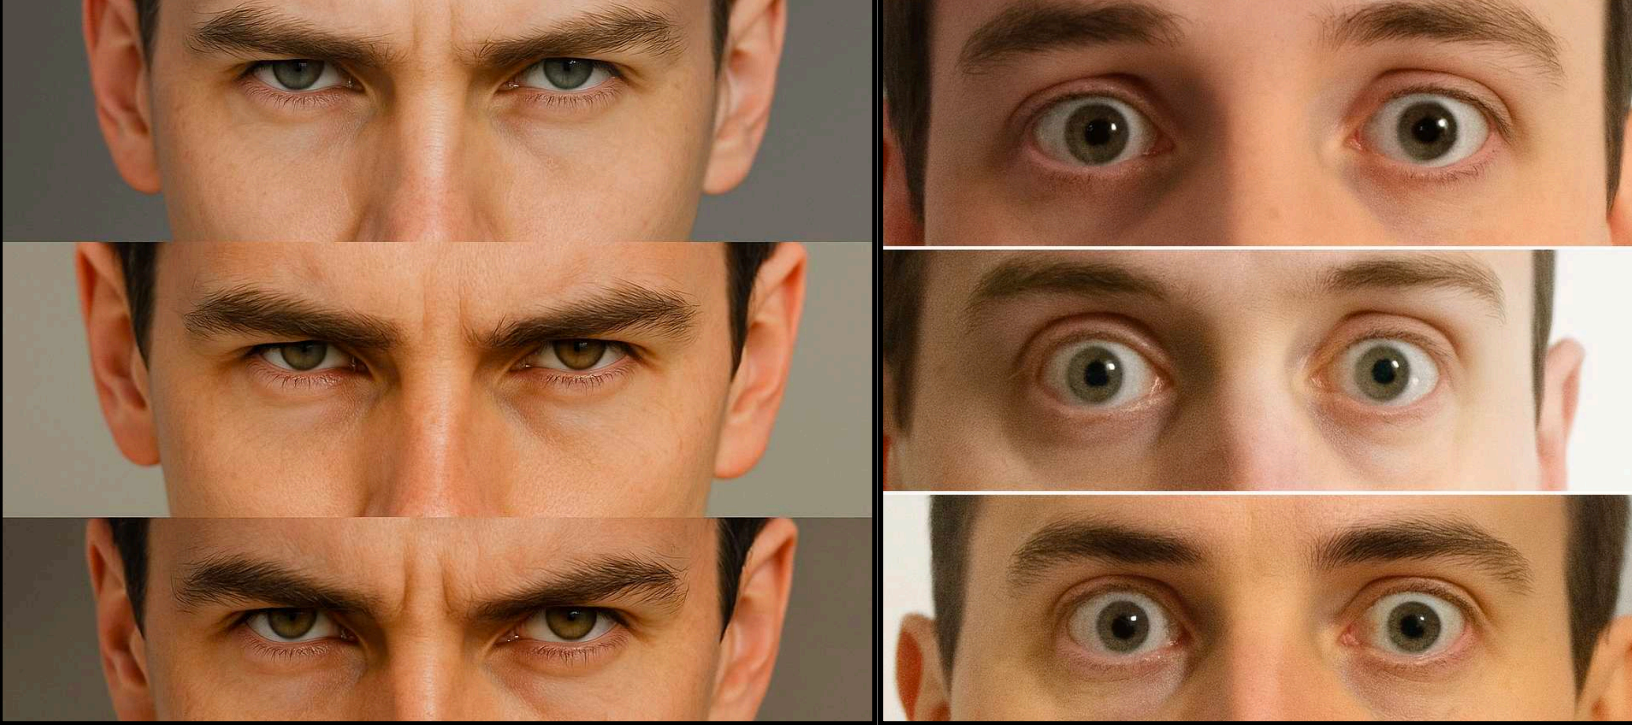

Eyes were your survival system:

- Hunter's Vision: Tracking movement required strong eye muscles.
- Health Signal: Bright, clear eyes signaled strong genes and vitality.
- Social Command: A steady gaze projected confidence and control.

Now we read:

- Sunken eyes: Tired, weak.
- Strained eyes: Stressed, unstable.
- Sharp eyes: Confident, trustworthy.

This chapter rebuilds your primal gaze.

Chapter 4: The Eyes

Prey Vs Hunter Eyes

Our goal here is surprisingly simple, give ourselves the “predator look”, that sharp, intense look. While it can be intimidating, it is something better than say “prey eyes”, docile or weak eyes.

We can make our eyes more muscular, improve our vision and get that intense look.

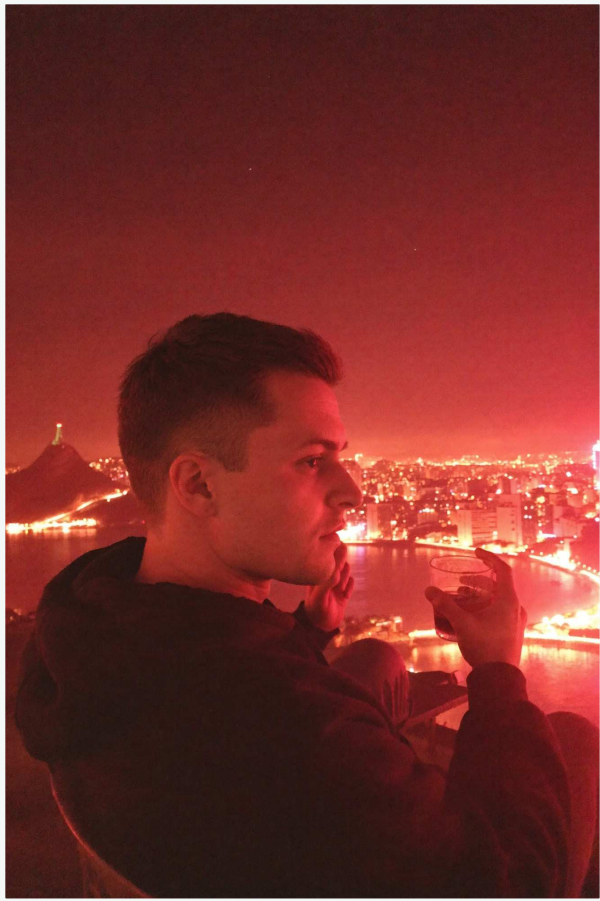

Asian Vs Non-Asian Eyes

With the exception of asians, all people will want to “narrow” their eye, improve their “fierceness.” However the “slanty-eyed” look isn’t appealing for asians.

Therefore for asians, the goal is to “open” the eye more but give it that elegant and graceful long “tailed” look.

Point blank, the eyes are weird. It’s going to take a lot of massages and a little bit of training to strain and work the eye muscles, the surrounding eyelids and even the iris itself. This section will take more time and likely can’t be finished in one day but it is well worth it. What we’re really trying to avoid is the “bug eye” look which happens with weak muscles. However, as our eye muscles get stronger, it will result in wrinkles, to avoid this we have to massage to get rid of those wrinkles and stresses.

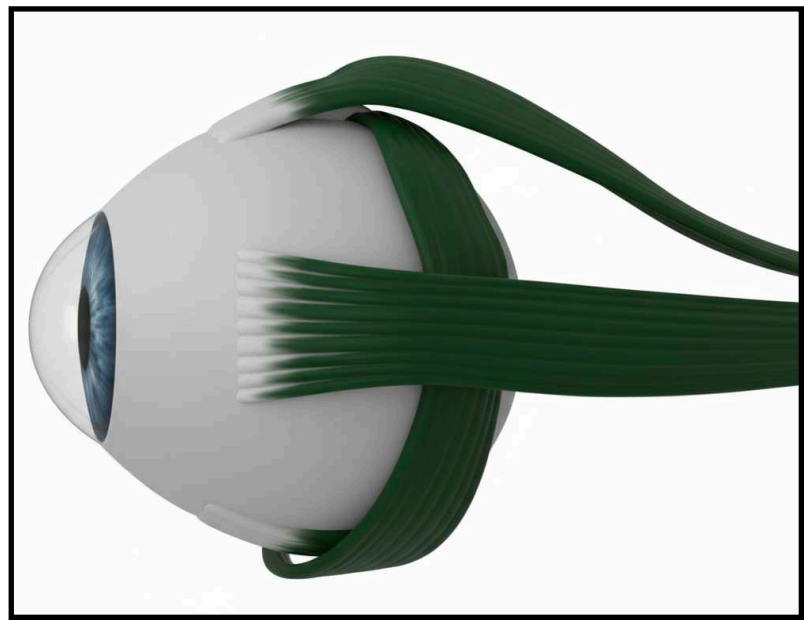

NYX DIRECTIVE

“All you need to know is that the eye is very close to a cup holder with a cup in it, tied to a nerve. When that nerve is overused or strained to zoom in on small characters on a screen, it tends to bulge out like a cup being set on something in a cup holder.”

The optic nerve does not sit on a muscle. Instead, it passes through the annulus of Zinn (also known as the common tendinous ring), a fibrous structure at the orbital apex from which four of the six extra-ocular muscles originate: the superior, inferior, medial, and lateral rectus muscles.

OPERATOR NOTES: SINCE HUMANS ARE BEHIND A SCREEN MOST OF THE DAY, IT'S LIKELY THAT OUR EYES "BULGE", THIS REALLY REDUCES OUR BEAUTIFUL SLEEK "HUNTER EYE LOOK" AND GIVES US THIS BULGY EYE LOOK.

The following exercises are super simple.

- Simply close your eyes and retract your eyes, via eyeball, up and back.
- Then do it x100 times directly back.
- And then x100 times left and right and down.
- You'll feel pretty quickly one side is stronger than the other, focus 10 to 20 reps on the weaker side - pulling it up either further or deeper into the sockets.

Once you get advanced, you can spread your eyes into diagonally in their sockets, the trick is just feel them going back

OPERATOR NOTES: YOU'LL WANT TO LAY DOWN FOR SURE, ON A BED PERHAPS, CLOSE YOUR EYES AND "FEEL THE PUSH IN" OF YOUR EYEBALLS BACK INTO YOUR SKULL. THEN PUSH IT IN VARIOUS DIRECTIONS BACK INTO THE SKULL. AFTER DOING A LOT OF REPS, LOOK IN THE MIRROR, NOTICE YOUR EYES WILL LOOK MORE "NORMAL" AND LESS "BULGY".

Muscular Exercises

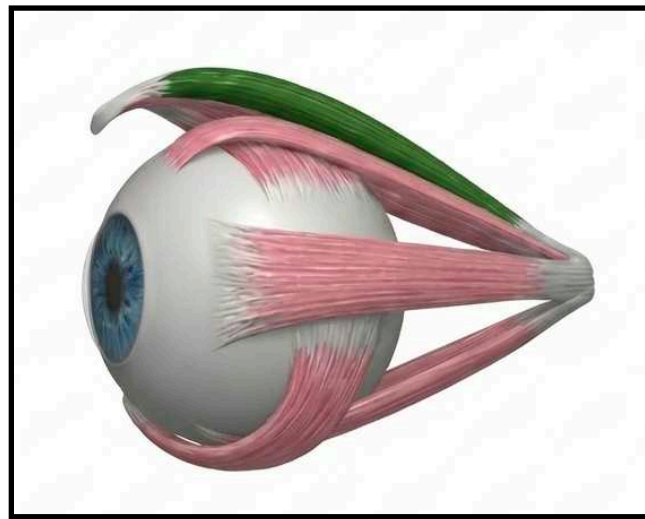

4.1 - Eyeball Exercises

Superior Rectus

Pure Upgaze Hold

Look up, close your eyes and push the eyeball up. You'll feel this muscle and all the blood flow.

Reps: 100

What This Does:

Creates a hooded eye look.

Controlled Upward Tracking

Sit with your head held level and in front of a mirror. Quickly raise your eyes as high as you can - then back down to your own eyes at a eye level. As you do 20 or 30 you can slowly raise your head up or down to make the exercise more challenging.

Purpose: This is the muscle's primary movement. It builds strength and control through the full range of upward gaze. The hold phase increases time under tension, which is key for muscle development and improved circulation.

Reps: For Complete Mastery - 120, but work your way up there

OPERATOR NOTES: THIS EXERCISE RAISES THE EYEBROWS FOR THAT NICE, ELEGANT CURVE.

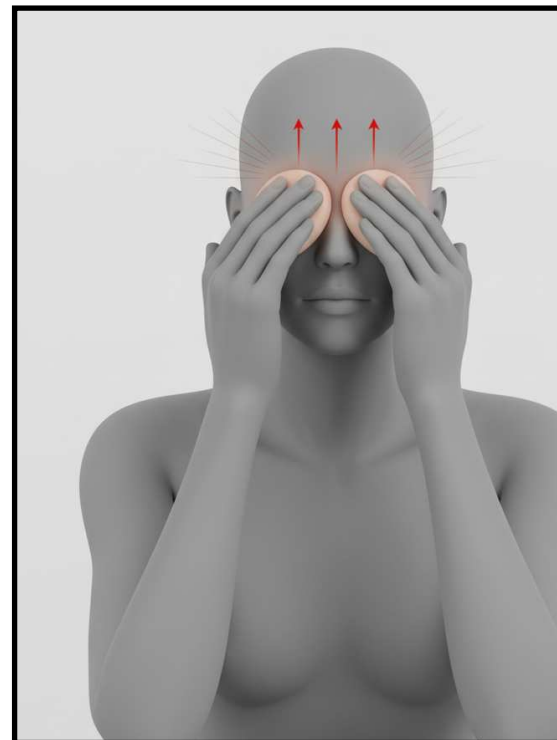

NYX DIRECTIVE

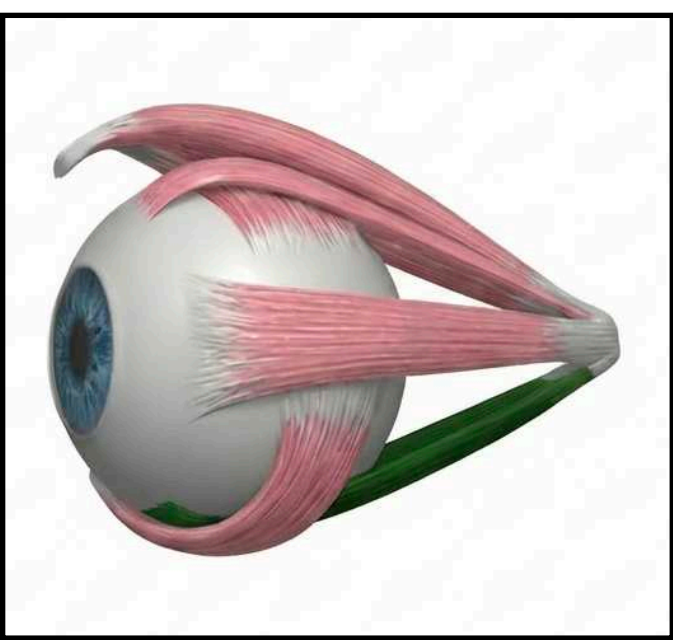

Palmed Upgaze Resistance

Warm your hands by rubbing them together. Sit with your elbows on a table and cup your palms gently over your closed eyes. Without moving your head, look upward as if trying to see your own eyebrows, pushing gently against the subtle, cushioning

resistance of your palms. Hold for up to 5 seconds, then relax.

Purpose: This is awesome as it lifts your eyebrows up due to the strength of your upper eye muscle. It will release all that blood flow into tired eyes and give you a refreshed look.

Inferior Rectus

Pure Downgaze Hold

Look straight down (without tilting your head), keep eyes closed. Shift your eye downward slightly then return to position, no

need to use fingers or resistance.

Beginner: 50

To Mastery: 120

Diagonal Downgaze Tracking

Hold a pen at eye level, then slowly move it down and inward (toward your nose).

Follow it with your eyes without moving your head.

Reps: 100

OPERATOR NOTES: WILL MAKE YOUR EYES BLURRY AFTERWARDS, MIGHT BE HARDER TO SEE FOR A MOMENT. CREATES THE ALMOND EYE LOOK.

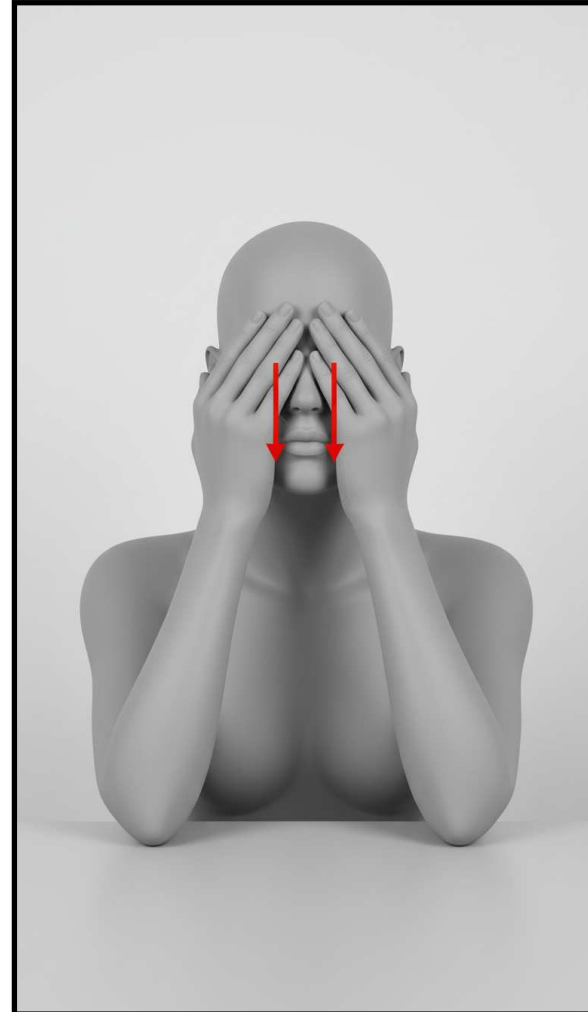

NYX DIRECTIVE

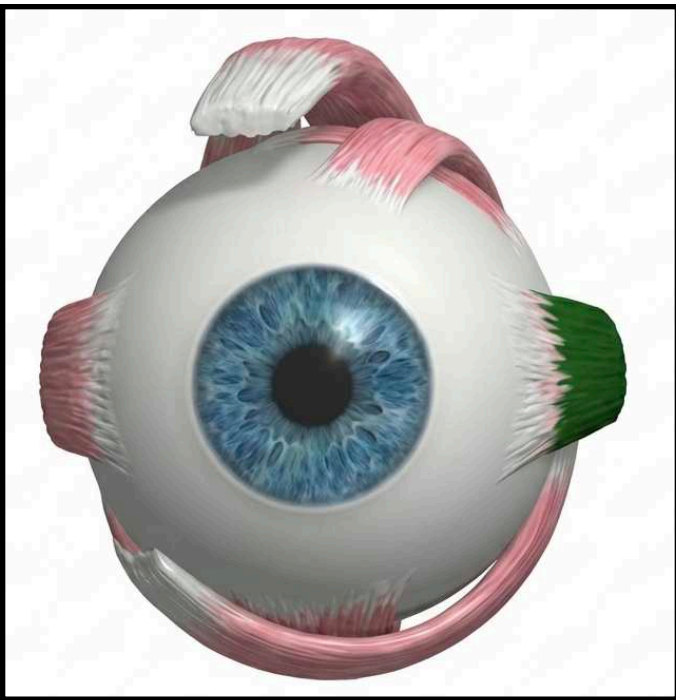

Palming Resistance

Sit with your elbows on a table. After warming up your eyes with the Pure Downgaze Hold, cup your palms over your closed eyes, applying gentle pressure. Without

moving your head, slowly look downward against the subtle resistance of your palms.

Reps: 20, finish with a 30 second hold

Medial Rectus

Bar none, perhaps the most important eye exercise, makes your eyes look refreshed and gets rid of eye bags

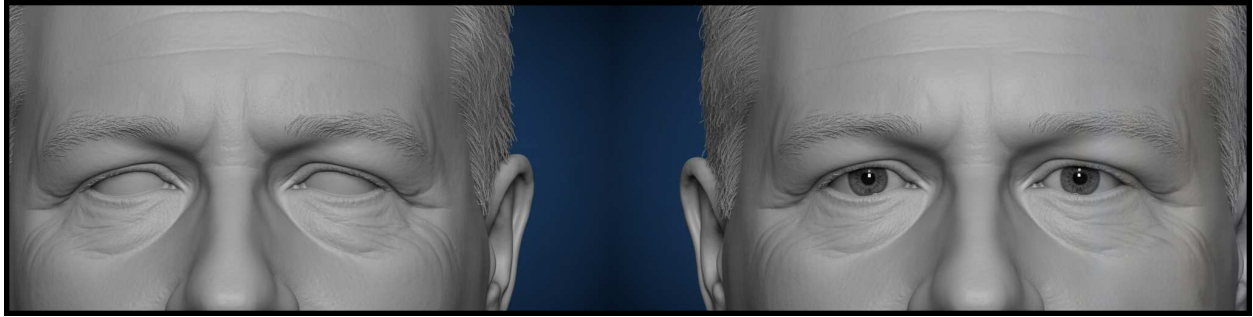

Side-to-Nose Tracking

Look at an object to your far left, then move your gaze smoothly to the bridge of your nose. *You can also do this with your eyes closed* (as I prefer and highly recommend). You will absolutely feel this muscle and that's what you should aim for.

Reps: 50, each side

OPERATOR NOTES: FEELS AMAZING, HELPS GET RID OF UNDER EYE BAGS, RELAXES THE EYE. MIGHT BE A LITTLE BLURRY AFTER, YOU SHOULD "FEEL" THE MUSCLE DURING THIS EXERCISE. ONE OF THE MOST POWERFUL ANTI-AGING EXERCISES, GIVES A MINOR "CHEEK LIFT". DON'T SKIP THIS EXERCISE!

What This Does:

Nasal Convergence Hold

Sit or stand facing a blank wall. Focus your eyes on a point on the wall. Slowly bring your gaze inward, crossing your eyes to focus on the bridge of your own nose, as if trying to look at it. Alternatively, you can cross your eyes to the inside and hold this. Think less of speed and more of concentration.

Purpose: This is a pure, intense isometric contraction of the medial rectus muscles. It directly strengthens the primary muscle responsible for eye convergence, which is vital for combating the outward "drift" and lack of focus that contributes to a tired appearance. The sustained contraction promotes blood flow and can help tone the surrounding orbital area.

OPERATOR NOTES: TEN IS MORE THAN ENOUGH, TWENTY IF YOU FEEL THIS MUSCLE IS WEAK

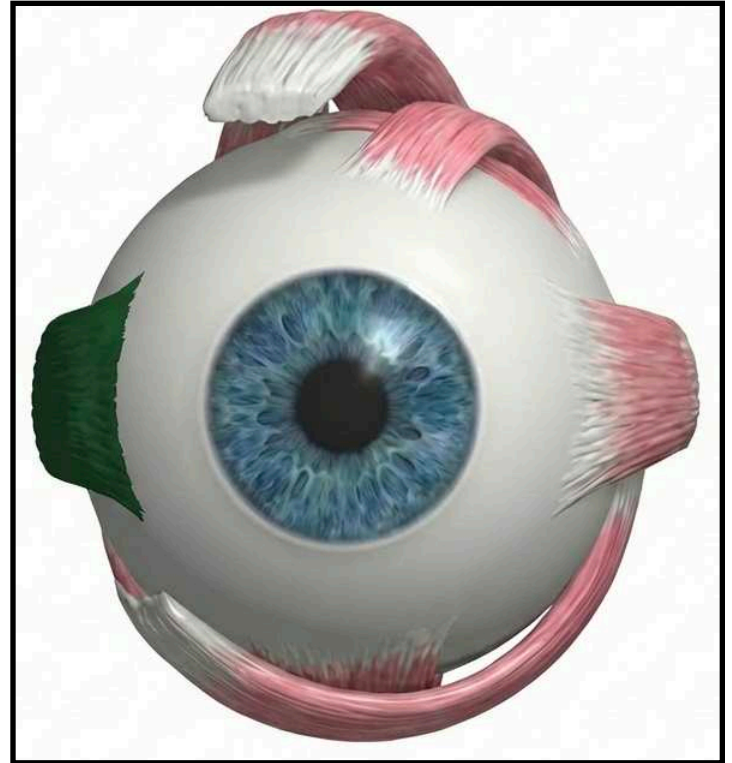

Lateral Rectus

Side-to-Nose Tracking

Look at an object to your far left, then move your gaze smoothly to the bridge of your nose.

Do x50 times each side

Feels amazing, helps. Can be skipped if you just do the next exercise.

Resisted Outward Gaze (Advanced)

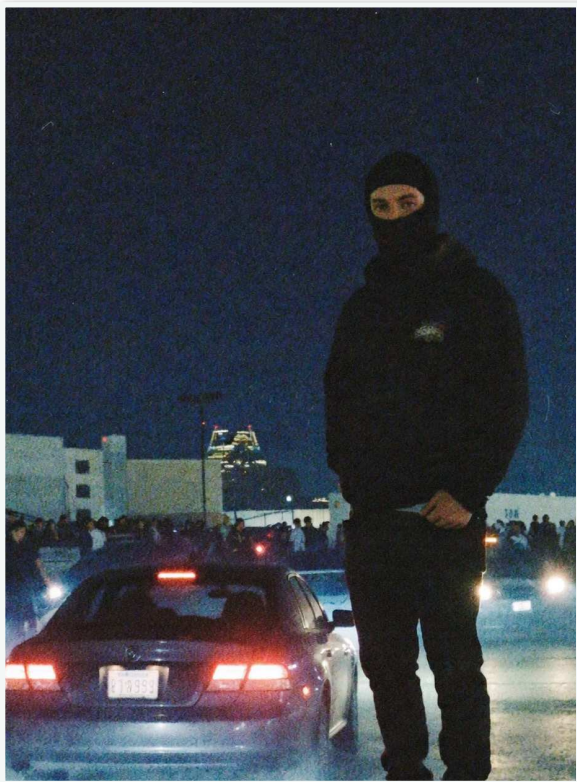

Close your eyes. Place the tip of your index finger very gently against the outer corner of your eyelid (over the

closed eyelid). Without moving your head, gently attempt to look outward toward your temple, creating a light isometric push against your fingertip. Hold for 3-5 seconds.

Beginner: 25, with one hand then repeat with the other hand or just do a total set of 60 one time

Intermediate: 25, four times

Will really help the muscle. You can do this one or the more advanced one below.

NYX DIRECTIVE

Far Lateral Gaze

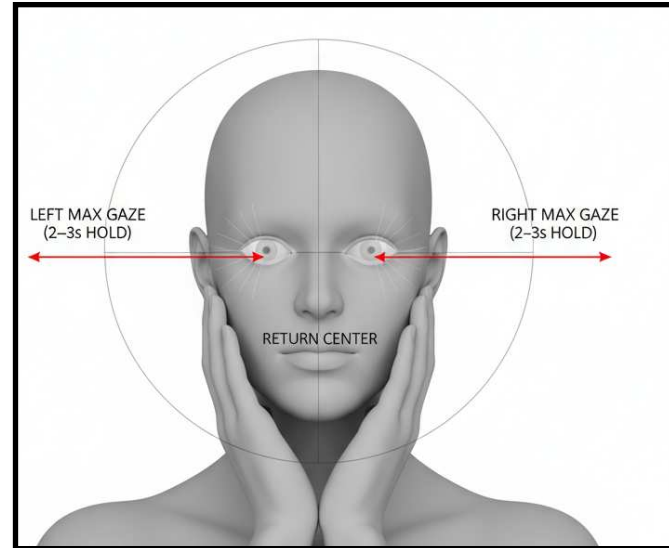

Sit facing forward in front of a mirror with your head resting on your hands that are criss-crossed. Without moving your head, look as far as you can to the left and by as far as we mean, do it to the point that your eyes are

stretching. Hold the far left gaze for 2-3 seconds, then return to center. Repeat to the right as well.

Purpose: This is the pure, primary movement of the lateral rectus, creating a gentle stretch and activation at its end range of motion. It is a foundational movement for full lateral mobility.

Reps: 30, max

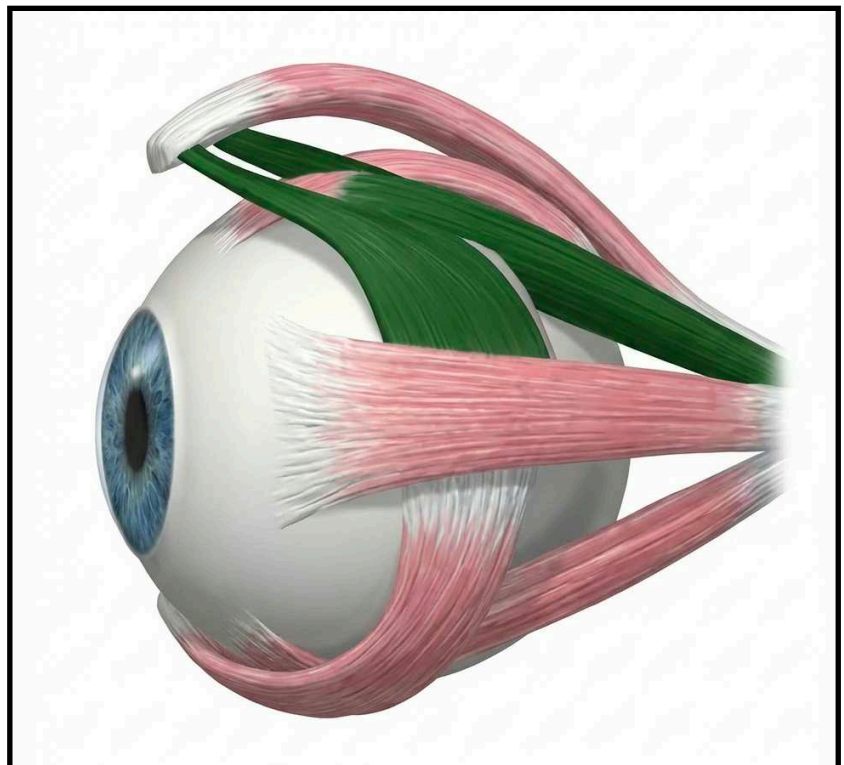

OPERATOR NOTES: THIS IS THE BEST EXERCISE TO GET THAT “SHARP LOOK” FROM ANY ANGLE, ALSO HELPS WITH GETTING HUNTER EYES.

Superior Oblique

Function: Rotates eye down and out (e.g., reading stairs).

Innervation: Trochlear nerve (CN IV).

Down-and-In Gaze:

Keep eyes closed. Look toward your nose and down (like reading a book on your lap). Curve the eye down and out.

Do x50 times each side

Lifts the cheeks up by the side of the eye. Giving an “elevated look”. The effect is very, very, very minor. But below is an extreme example.

What This Does:

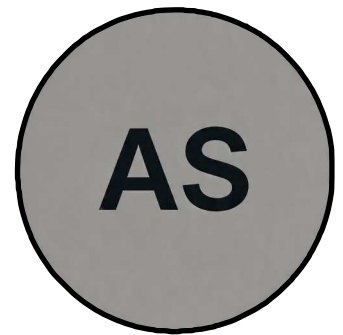

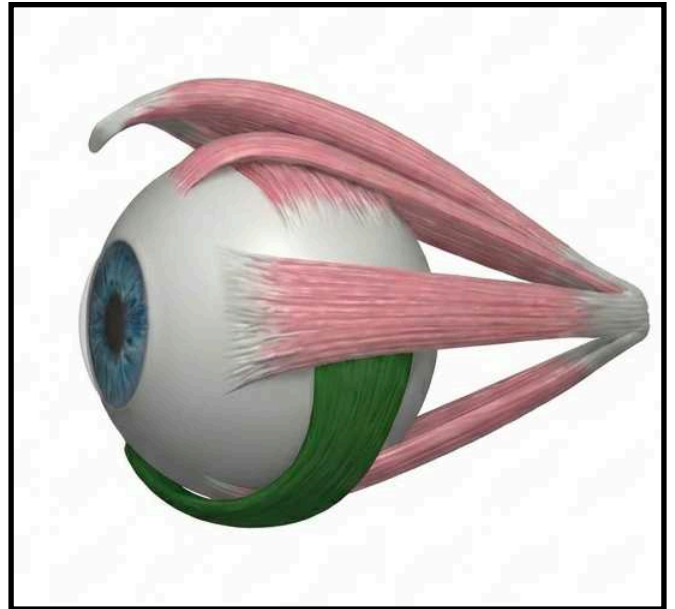

Inferior Oblique

Function: Rotates eye up and out (e.g., checking rearview mirror).

Innervation: Oculomotor nerve (CN III).

Up-and-In Gaze:

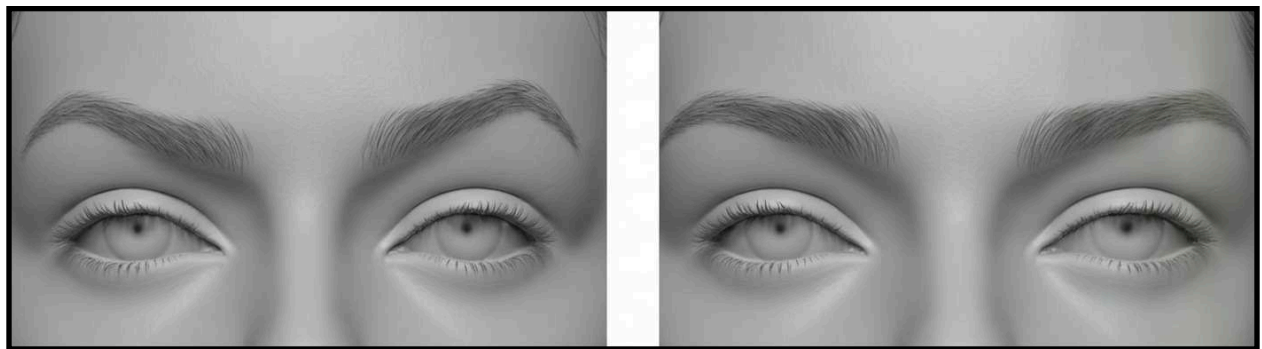

Close your eyes, look toward your nose and up and rotate around the upper socket of the eye. Return to the original position. Just the opposite of what we did with the superior oblique above. Very simple. Very often one side is stronger than the other, make sure to do the weak side more and focus on that, symmetry is more important than strength in the face.

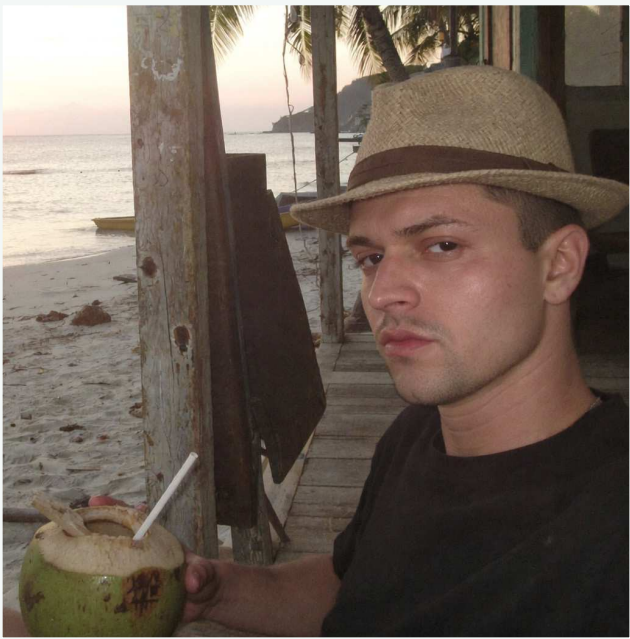

Do x50 times each side

OPERATOR NOTES: YOU CAN FEEL THIS MUSCLE, IT MUST BE DONE SLOWLY. RAISES THE LOWER EYELID.

What This Does:

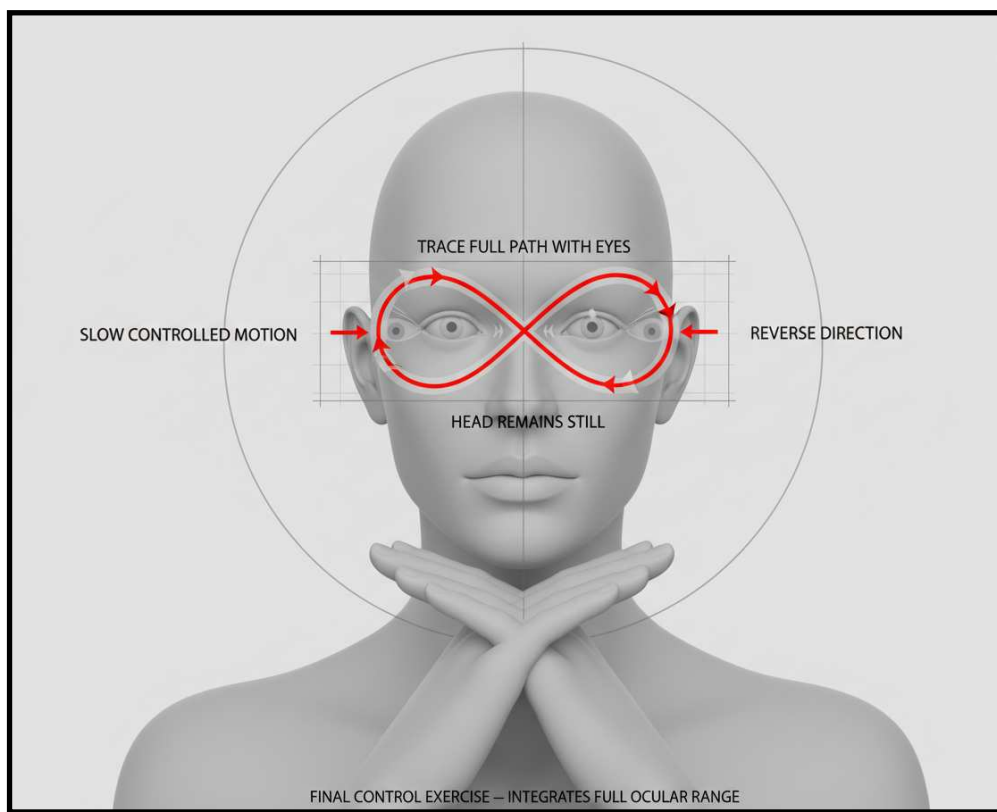

NYX DIRECTIVE

Figure-Eight Downgaze

Once you have mastered the various eye exercises, add this to your kit to round off any weak points. Imagine a horizontal figure-eight (∞) on a wall. Slowly and smoothly trace this entire shape with your eyes, focusing on every arc of the pattern. Keep your head perfectly still. Perform the motion first in one direction, then the other.

Finish off with this exercise, until your are comfortable.
100 times

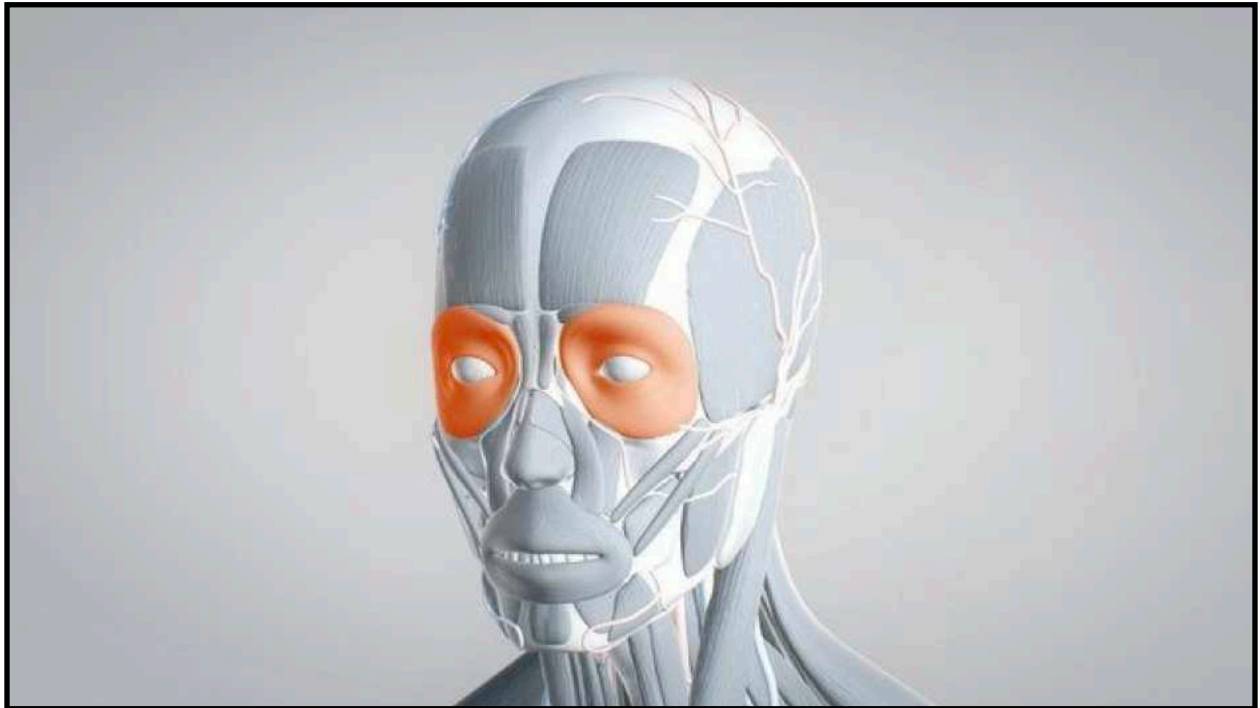

Does not distinctly help any muscle but helps prevent

poor eyesight by focusing the eyes, will help with seeing distant objects as we sit behind computers all day.

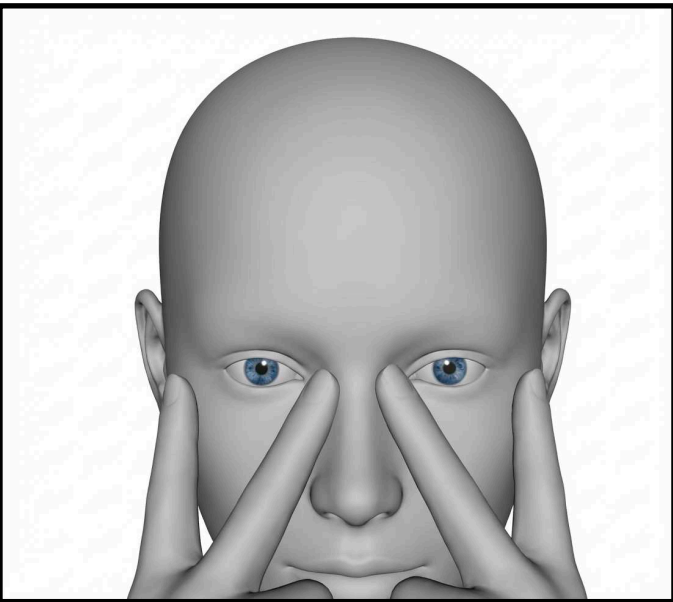

4.2 - Eye Exercises

Orbicularis Oculi

This is perhaps the third most important exercise. This is the only muscle responsible for the eyelids, it's rather large and flat.

Take your time with these, use oil on your finger tips, don't crunch the skin. As your eyelids get stronger, you will see more and more crinkles or lines, simply use massages to eliminate those and pull the skin back.

The "Wide-Eyed" Hold

Place your index fingers gently at your outer brow and your middle fingers at the outer corners of your eyes. This is to prevent you from cheating with other muscles.

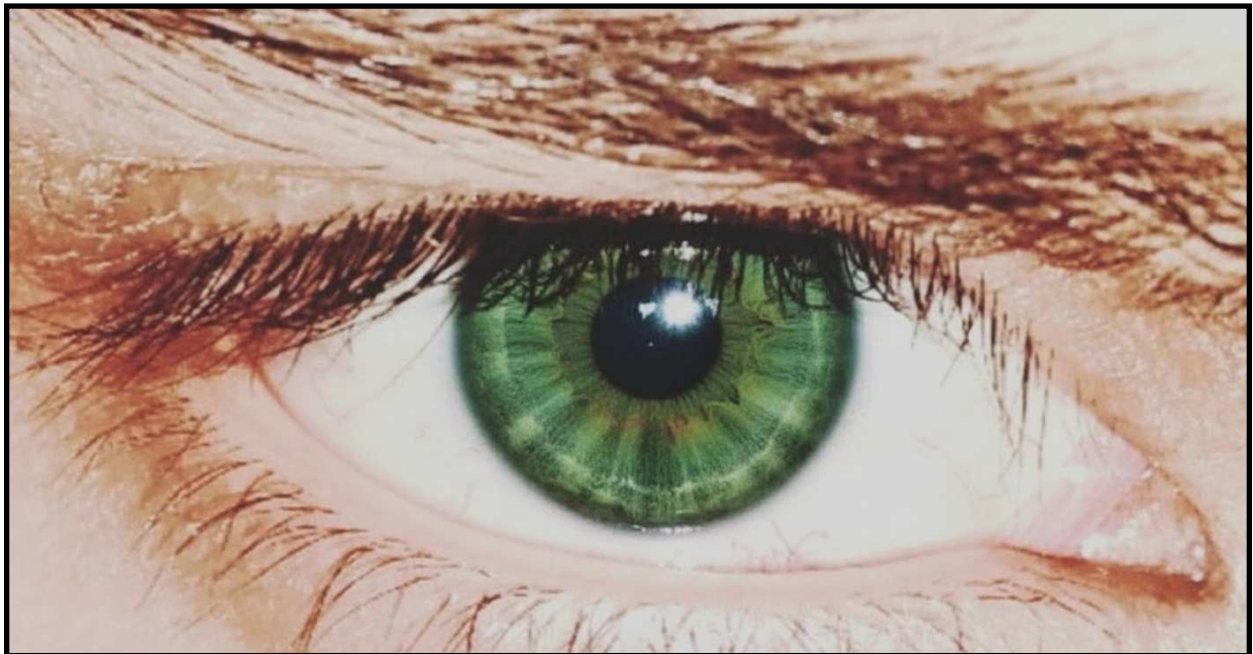

Open your eyes as wide as you can, as if in genuine surprise, while using your fingers to provide slight resistance. You should feel the entire orbital area engaged. You can hold the rep occasionally to make it tougher.

Beginner: 40,

Intermediate: 100

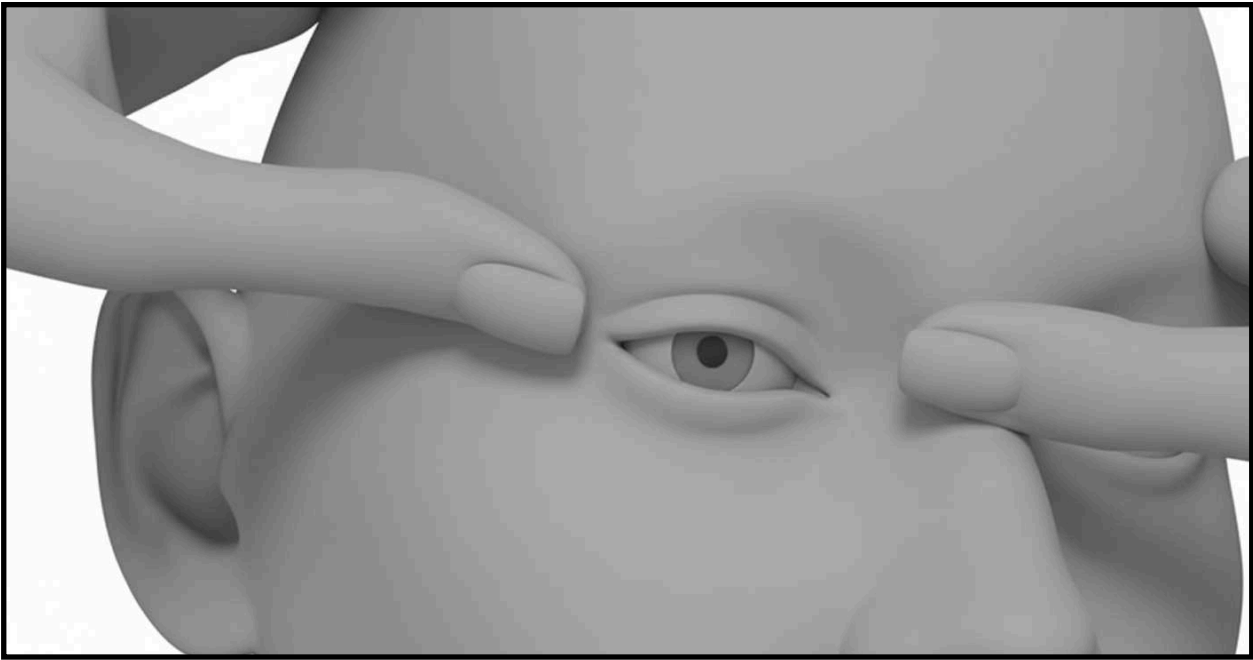

Will help give a natural and good curve to the eye, almost hunter-eye like.

What This Does:

Two Handed Eye Workout

Use a finger (I use three fingers) on the other side to stretch the eye, try to close it and return it to a normal

position. You can use oil under the eye (just a little) so the eye underneath doesn't develop stretch marks.

Beginner: 20

Intermediate: 40

Expert: 100

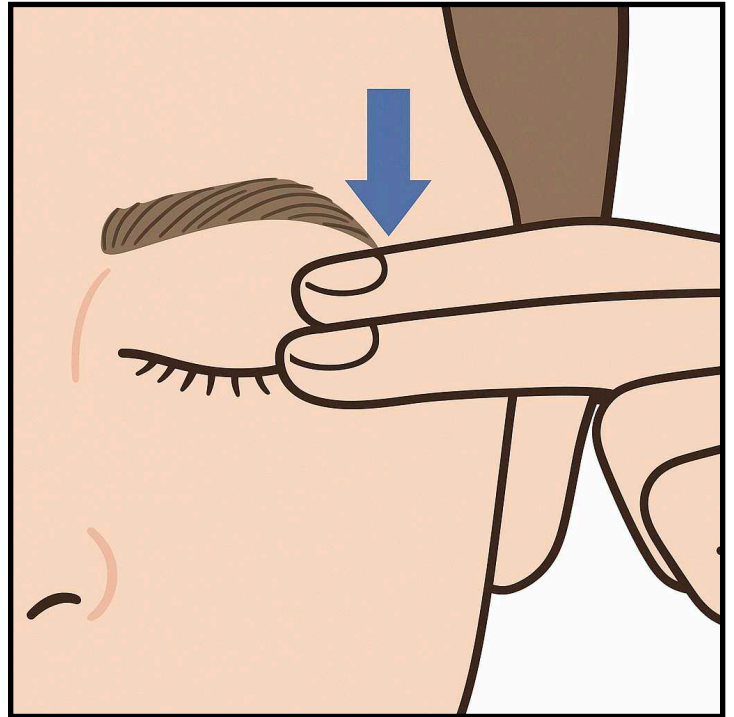

This helps enormously and is the primary exercise to get hunter eyes.

What This Does:

Upper Eyelid Resistance

Oil up your fingers, close your eyes tightly, then place two fingers on the upper eyelid and try to push those fingers down. This will thicken up the upper eyebrow since generally, our upper eyelid is always weaker than our lower eyelid.

Beginner: 40

Intermediate: 100

This will feel very **weird**. Accept it. Do not, under any circumstances, **press into your eyelid**. **Do not poke your eye**.

What This Does:

Eyebrow resistance

Place fingers on your lower eyelid, try to push down and open the eye, **resist**. You won't need oil for this exercise. Do the opposite on the opposite with your opposite top side of your eyebrow. You can do it on one side more if you feel weaker. You should feel the eyelid "thinning"

X50

Gives you thicker eyelids. This is necessary for Asians to do, as contrary to popular belief, they actually have

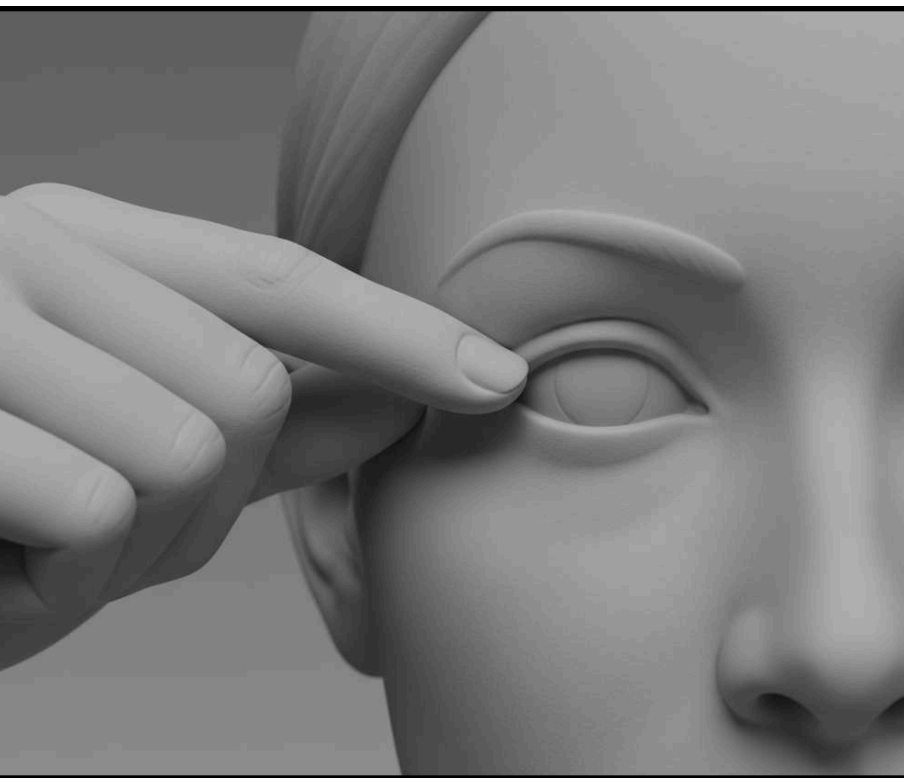

weaker eyelids. This does give me the “tired look” but I do it anyways since thicker eyelids can be thinned out with massages.

What This Does:

4.3 - Eye Relaxation

As you do these exercises you may develop a sunken eyes or “tired look”.

The Critical "Anti-Sunken" Stretch:
Relaxing the Depressors
A major cause of a tired look is the

constant downward pull from muscles between the brows. You must relax these.

Target Muscles: Corrugator Supercilii (pulls brows together) and Procerus (pulls brows down).

The Release:

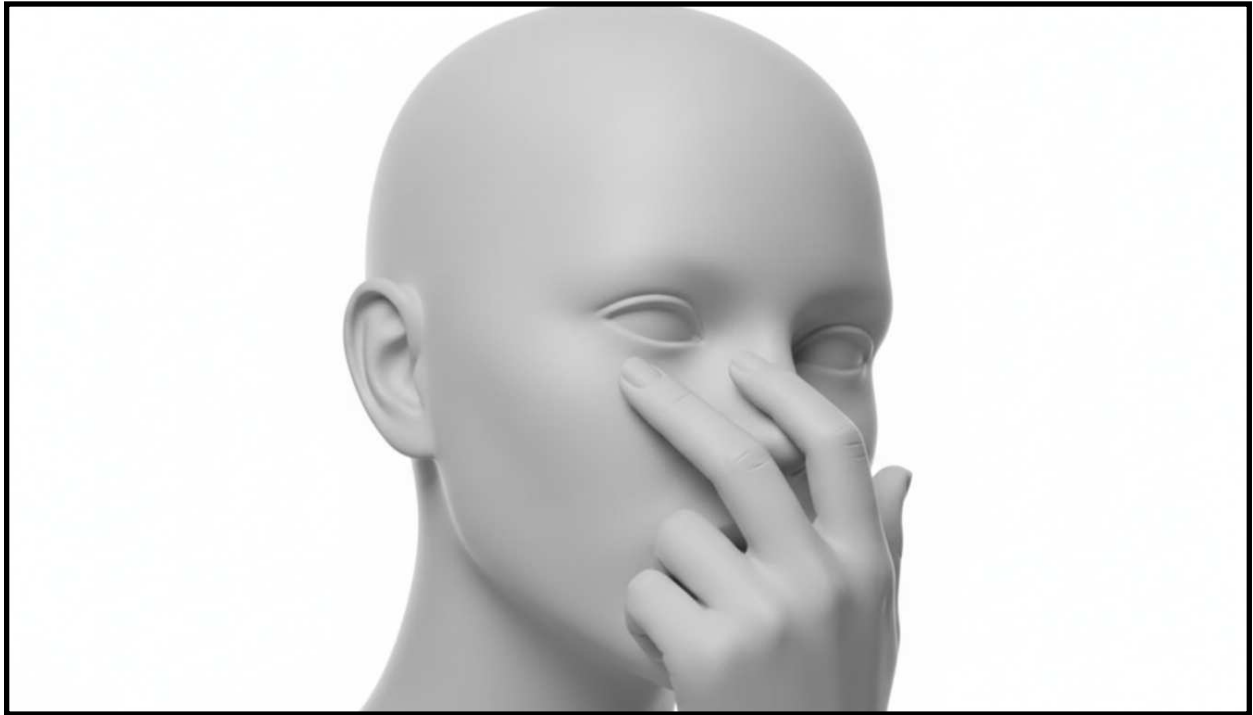

Use your thumb and forefinger to firmly pinch the inner corner of your eyebrow and the bridge of your nose.

Apply deep, sustained pressure for 30-60 seconds while breathing deeply. You are manually releasing the tension in these muscles that create a "pinched," sunken look at the inner eye.

Massages

4.4 - Eye Massages

The thing about these massages is that you should strengthen your eyes first - do the muscle exercises, which will give you the structure. However doing exercises will give you wrinkles - naturally, so the massages counter this and help “set the eyes”.

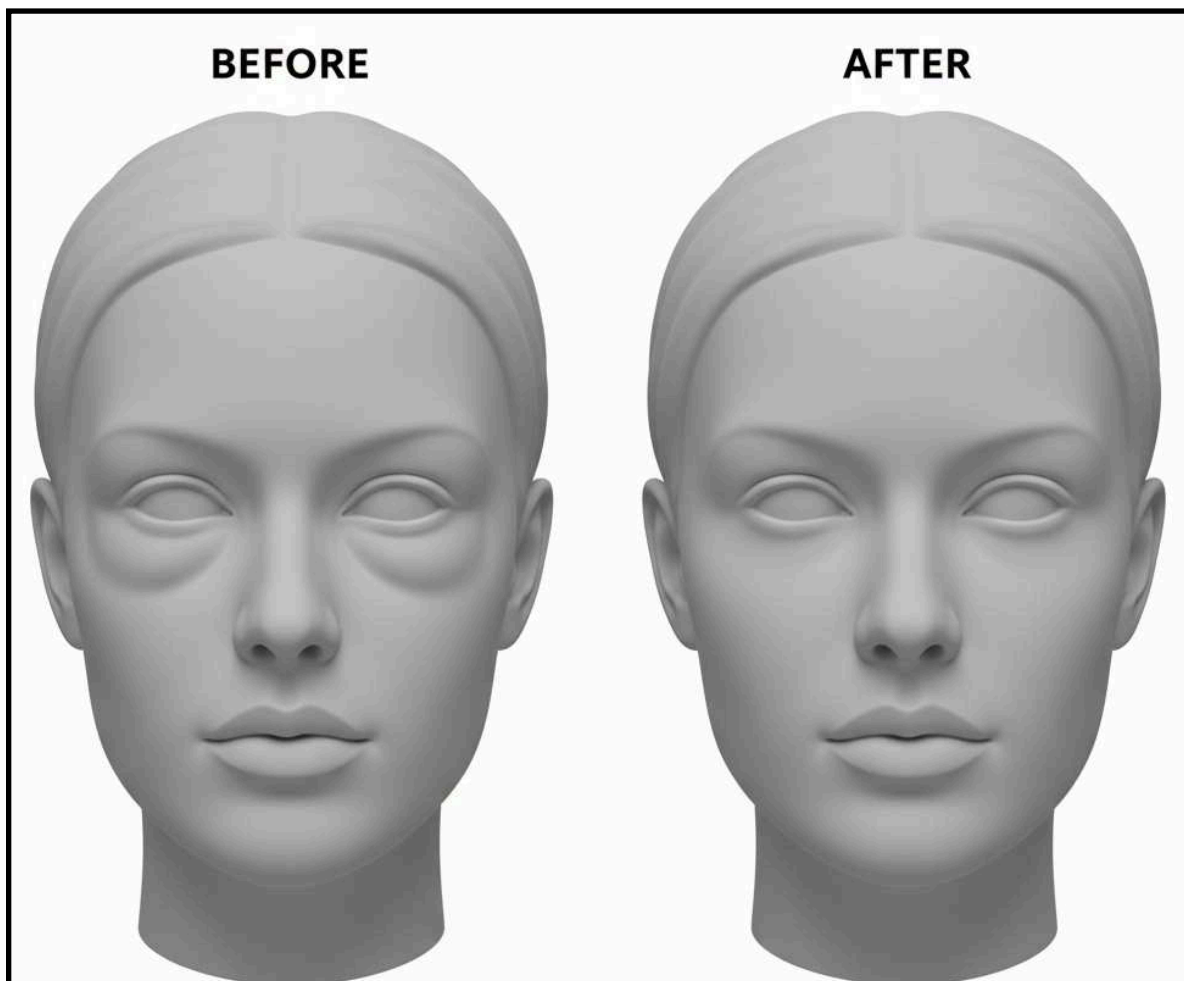

Lower Eye Stretch and Massage

One finger (ideally two) on the nose, the other one (ideally two fingers) sweeping aside to remove the under eye bags.

Reps: 50

OPERATOR NOTES: IT DOES SORT OF WORK BUT TAKES TIME AND IS TEMPORARY FOR THE MOST PART. DOES HELP RESHAPE THE MUSCLES UNDER THE EYE AND AS YOU WORK THE EYE MUSCLES, THEY WILL BUILD UP MASS IN STRANGE AREAS, THIS ONE SHOULD BE DONE. CREATES A BIT OF A “SUNKEN EYE” LOOK IN A MORE NATURAL WAY.

What This Does:

Upper Eye Stretch and Massage

Fingers on top of scalp, pull up the eyebrow, way up - you can use three. Run the fingers across the upper eye and even the eyelid, use plenty of oil (helps to heat the bottle of oil beforehand).

Ensure your hands are clean.

Beginner: 20

Intermediate: 50

Expert: 100

Relaxes the eye but also lifts the upper eyelid, giving a "friendly look".

Knuckles Under the Eye Massage

Knuckles or strict finger pressure under the eyes, will squint involuntarily. Rub it out and towards the cheeks. Use plenty of oil and make sure to have a slightly wet towel or a sink nearby to wash off.

Reps: 50

Helps the long eye stretch. I haven't seen this be totally effective, can be skipped but definitely try it out and see if it benefits you.

Circular Eye Massage

Rub middle finger or ring finger around the eye. From the bottom, all the way around through to the brow in a full circle, don't stop. I recommend using two fingers and moderate pressure.

Beginner: 30

Intermediate: 50

Expert: 100

This helps set the eyes. It helps relax them, will ironically make the tired eye with deep blue under the eyes but this will fade away.

For an added bonus, do an additional 100 of using your oiled fingers and your eyes tightly shut, across the eye, from inside to the outside. One finger for the upper eyelid and one for the bottom finger. Wash off your hands and your eyes, from inside to out twenty times to get all the oil off.

What This Does:

For All The Following Massages, Rep X50 Times...

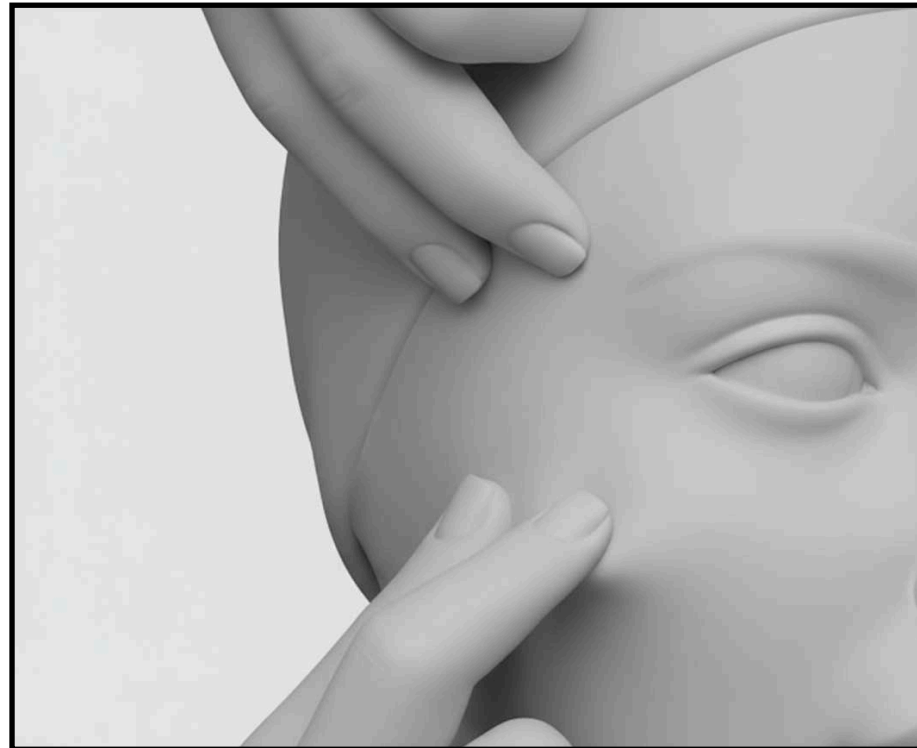

Side of the eye Stretch

Two fingers each side,
pull and stretch apart,
repeat. **Make sure you
use plenty of oil.**

Whole Eye Stretch

Two fingers each side,
some of them on the eyebrow and others beneath the eye,
and pull apart. Really stretch that eye out.

This will pull up the eyebrows in a beautiful way.

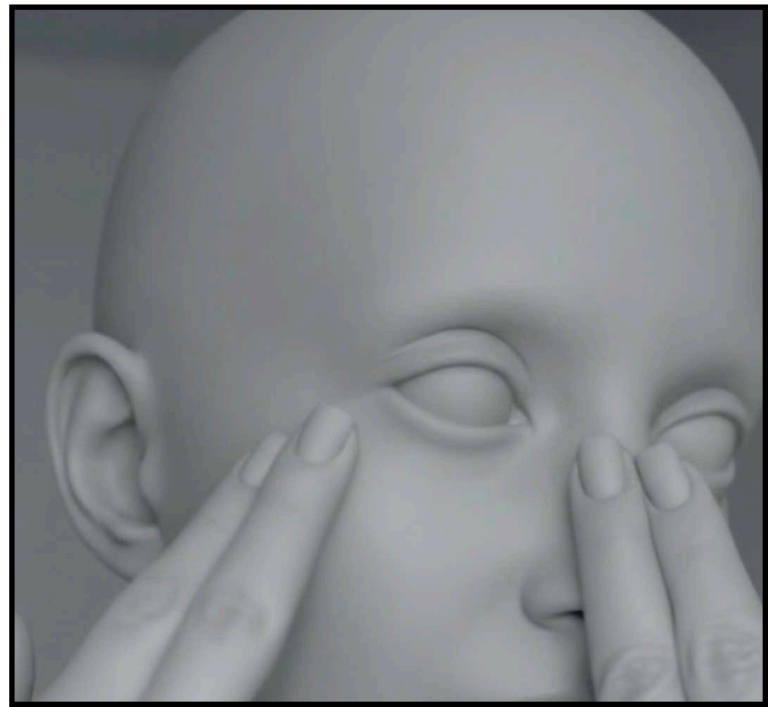

Knuckle across the upper eye

Stretch with one hand, use a knuckle and stretch it out.

Lower Eye Stretch Massage

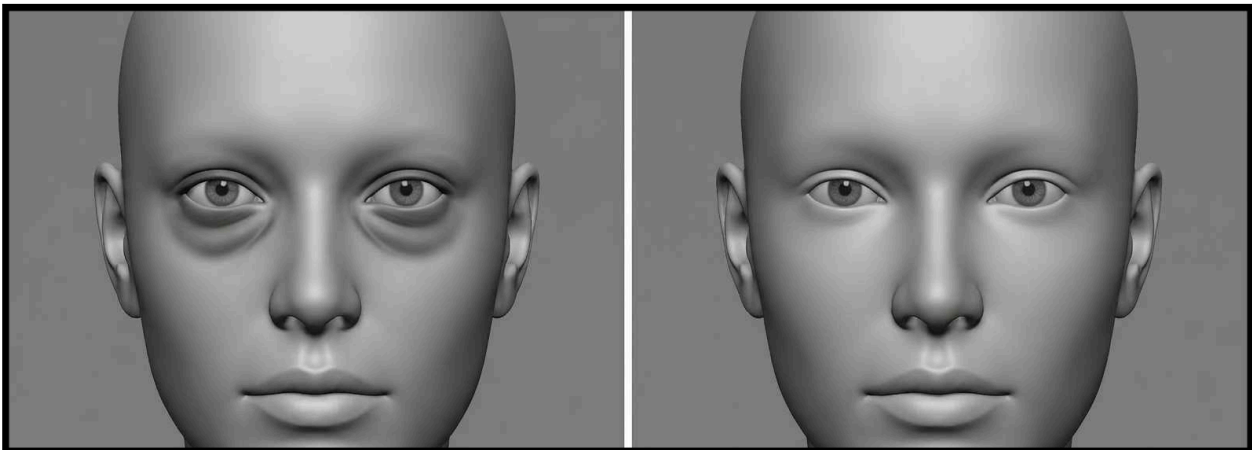

Start from the center of the eye with four fingers, two fingers each hand, stretch out the lower eye. Use face oil, of course. You can use moderate pressure. Every twenty reps or so, use the hands the furthest out to really stretch

out the skin. You should use the hand closest to the eye to “push up the skin into the side of the nose”.

OPERATOR NOTES: COMPARE THE ONE SIDE AFTER YOU HAVE DONE THE REPS TO THE OTHER. THIS MASSAGE HELPS “SETTLE IN THE EYES” AFTER STARING AT A SCREEN ALL DAY, REMOVING THAT LOWER EYE BULGE EVERYONE HAS. THE BELOW IMAGE IS GREATLY EXAGGERATED BUT COMBINED WITH THE BELOW MASSAGE - IT WORKS. THE SIDE THAT IS HARDER TO DO IS THE ONE YOUR NOSE IS MISPOSITIONED IN.

What This Does:

Upper Eye Glide

Two fingers each hand,
stretch out the eye for the
foxy eyed look.

OPERATOR NOTES: THIS MASSAGE IS HIGHLY IRRITATING, IT CAUSES VERY OFTEN OIL TO GET INTO THE EYE, MAKE SURE YOU'RE ABLE TO WASH YOUR HANDS AND USE A TOWEL AFTERWARDS TO PAT DRY. DO NOT USE HEAVY MACHINERY OR DRIVE A VEHICLE AFTER DOING THIS MASSAGE AS YOUR VISION MAY BE SLIGHTLY CLOUDY. MAKE SURE TO USE HIGHLY FRIENDLY OILS TO THE SKIN - SUCH AS ALL NATURAL GRAPESEED OIL.

Inner Eyebrow Kneading and Deep Tissue Massage

Massage between the brows with two fingers each hand, relax the tension and muscle.

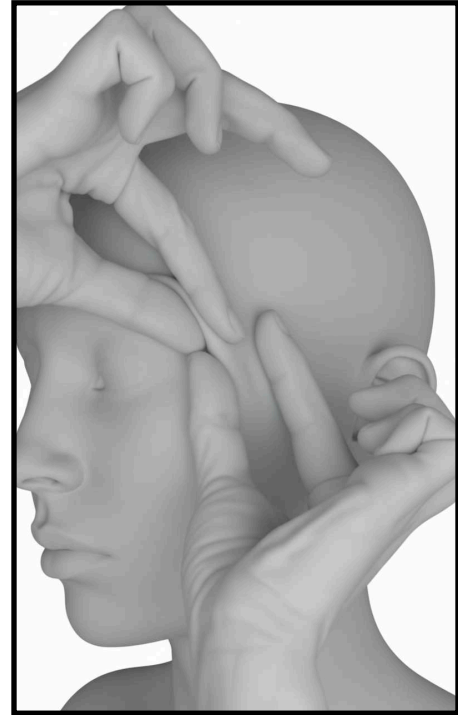

You can use your thumbs for support, this is technically a brow massage but it helps settle the tissue around the eyes as well.

A really really good massage, helps remove a few wrinkles in the forehead, space out the eyes more and relax the muscles. If you do lots of face exercises, the muscle will

build bulk there, making the entire face look unfriendly.

Side of the Eye Bundling Massage

Massage between the brows with two fingers each hand, relax the tension and muscle.

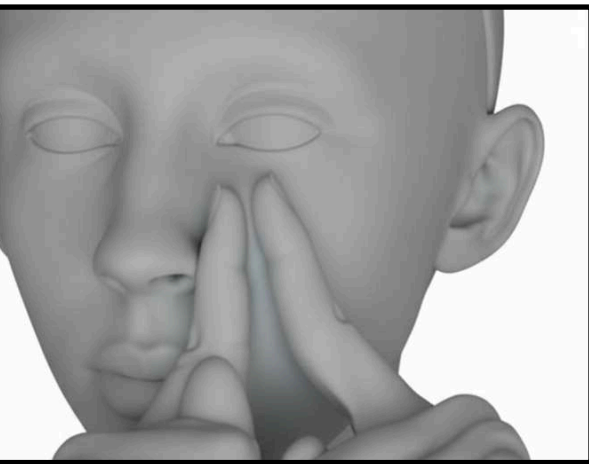

Pinch and Glide Eye Massage

Utilize two fingers, pinch in and extend it out to smooth it out. Helps get rid of under eye folds.

Highly effective but just hard to do, especially with oily fingers, which

you'll need to do.

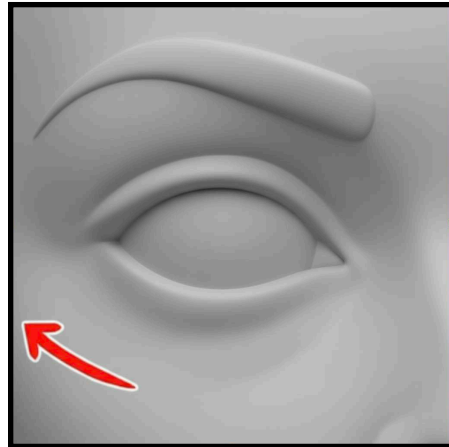

Side Eye Forced Stretch

Stretch out the sides
Reps: 50

What This Does:

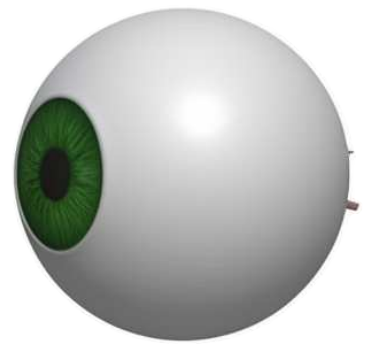

Refinement

4.5 - Further Eye Manipulation

Iris Sphincter & Dilator

WARNING: This exercise can damage your eyesight. Do not be careless. You must perform it at an absolute minimum—or not at all.

I strongly dislike this exercise. There is a legal term and condition written specifically for it. You are perfectly fine skipping it entirely.

Pupil Response Training:

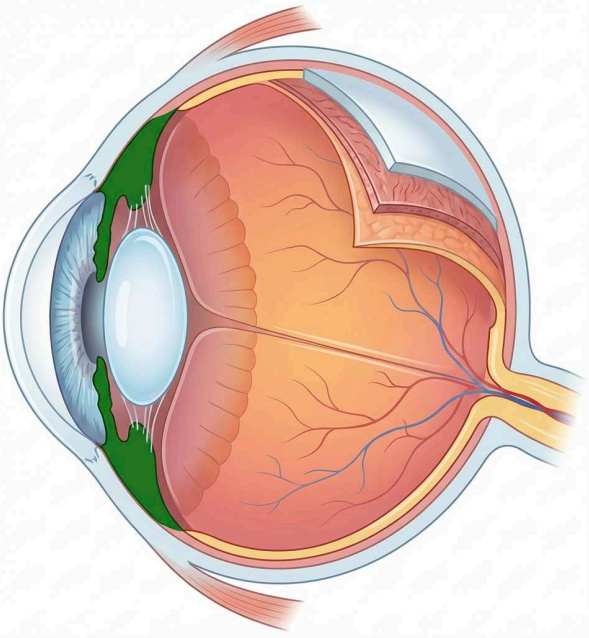

Wear protective yellow glasses that block blue light to avoid damaging the eye. Sit in a dim room, shine a penlight for 1 to 3 seconds maximum to trigger constriction. Remove light, let pupils dilate. Force them to constrict. This will tire your eyes, very quickly. Do not overdo this!

X10 - Don't do more than this, really, ever. Under any circumstances.

OPERATOR NOTES: YOU CAN FEEL THE MUSCLE IN THE EYE CONSTRICTING, DON'T OVERSTRAIN IT. THIS CAN KIND OF HURT. MAKES THE PUPILS SMALLER, GIVING AN "EAGLE EYE" LOOK. WON'T LITERALLY GIVE YOU EAGLE EYES BUT WILL MAKE YOUR PUPILS SMALLER OVER TIME.

What This Does:

Ciliary Muscle

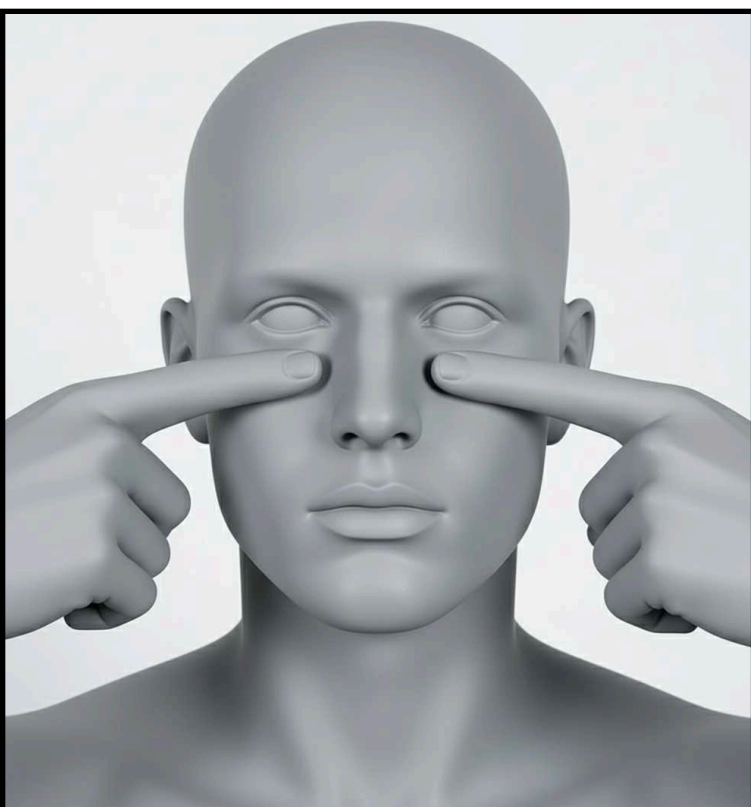

There is no danger to working this muscle, it will help with vision and age related damage to the eye

Function: Changes lens shape for near / far focus (accommodation).

Control: Parasympathetic (CN III).

Near-Far Shifts:

Hold your finger at 10 inches or 20 inches, you can vary focus for 3 to 5 seconds then shift your gaze to a distant object (10+ feet, 20+ feet or even 100+ feet), hold 3 to 5 seconds.

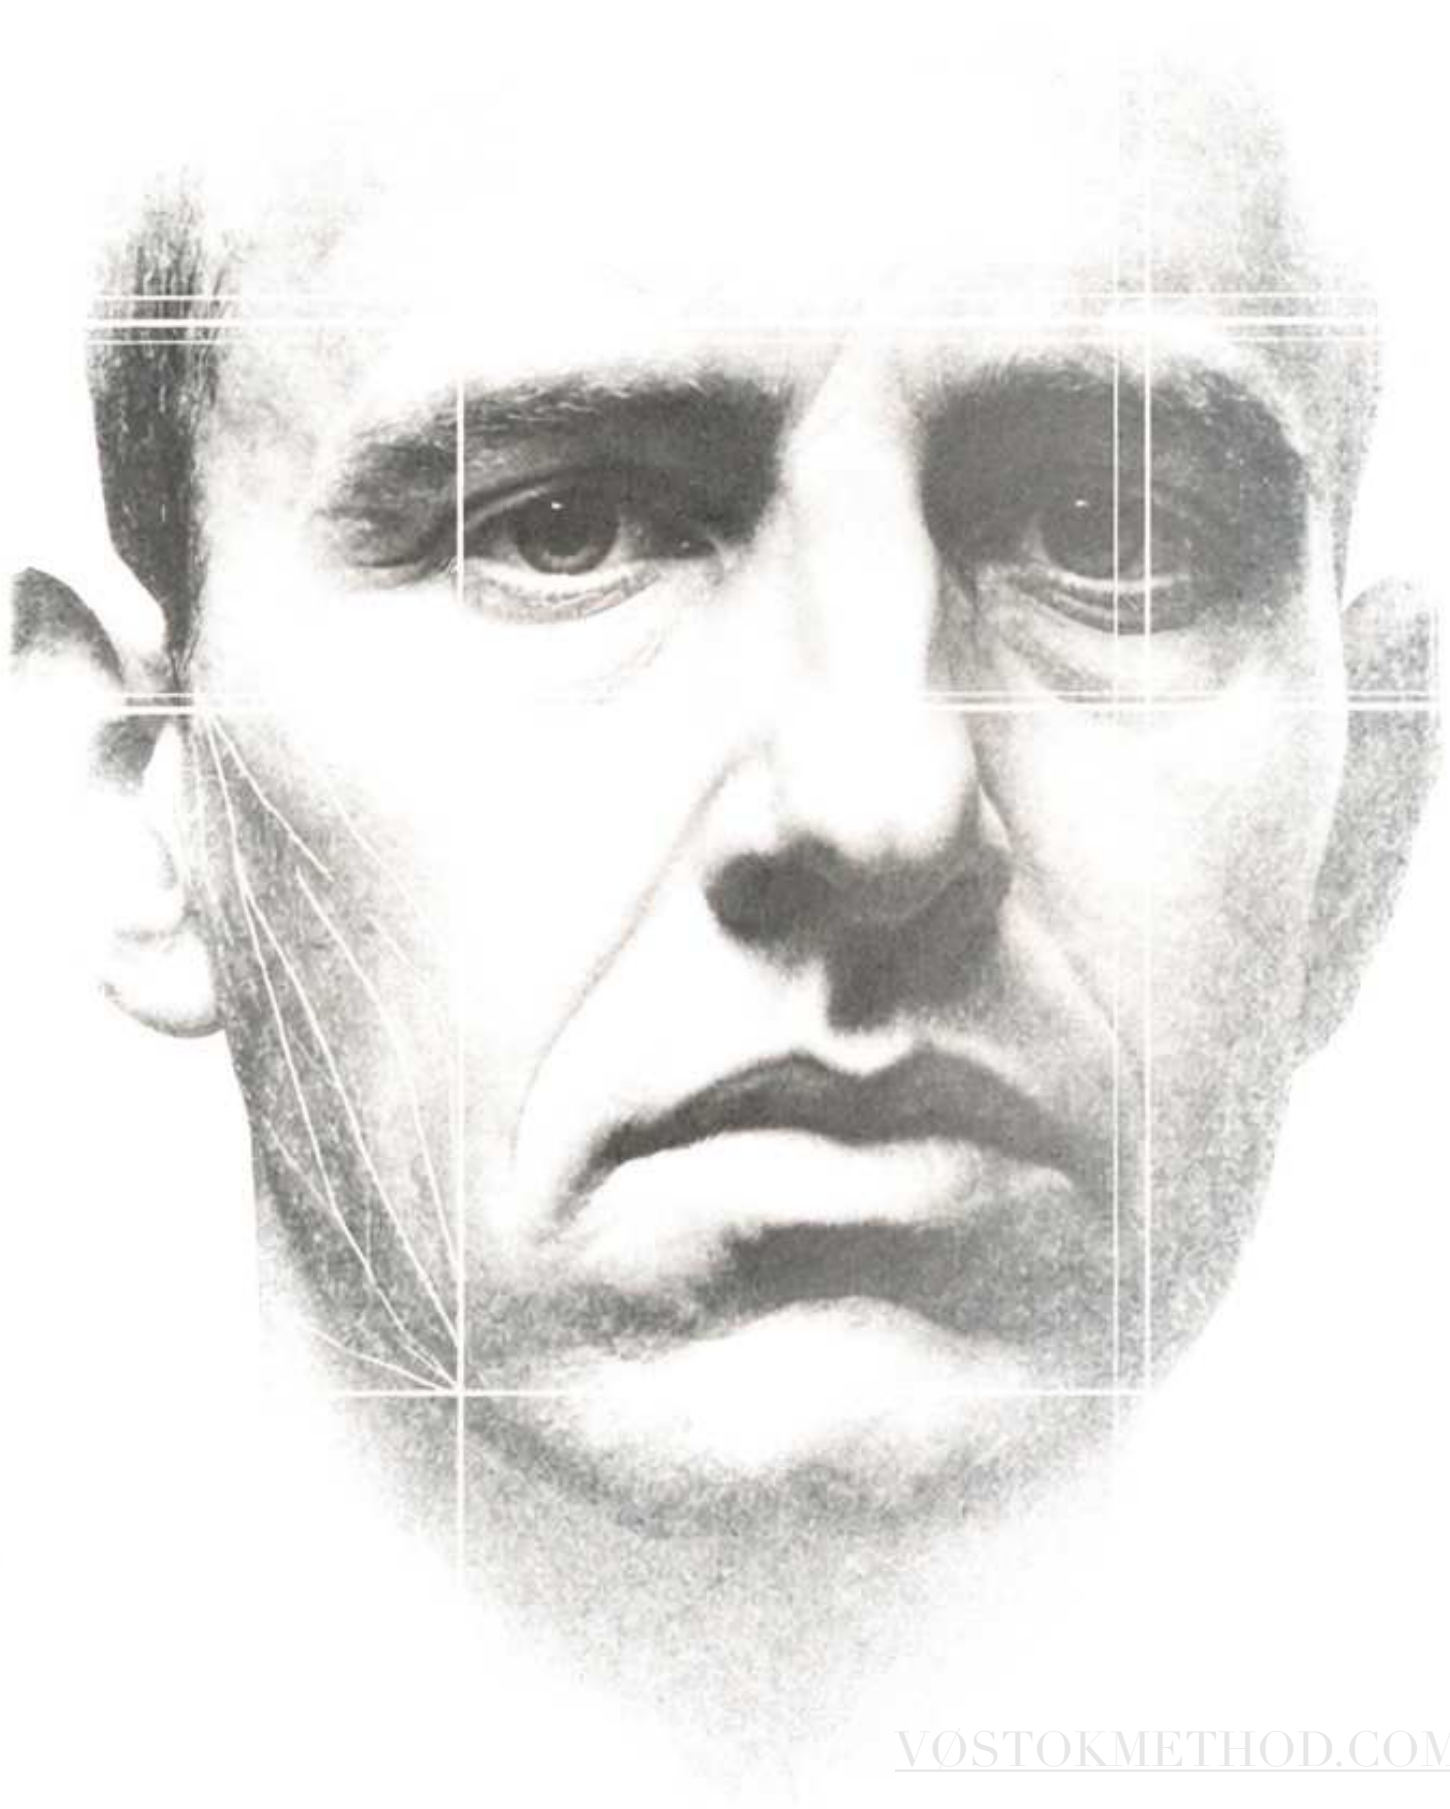

Lower Eyelid Press

By pressing hard - here, under our eyes, can get rid of those pesky eyebags. If you see

stars, lighten up the pressure immediately. If you have long nails, be careful not to poke your eyes.

Reps: 30 seconds, press hard, do multiple times, you can do up to 100 seconds once you've mastered things.

VØSTOKMETHOD.COM

The Architectural Pillars of Your Face

For our ancestors, strong cheeks were a non-negotiable survival tool:

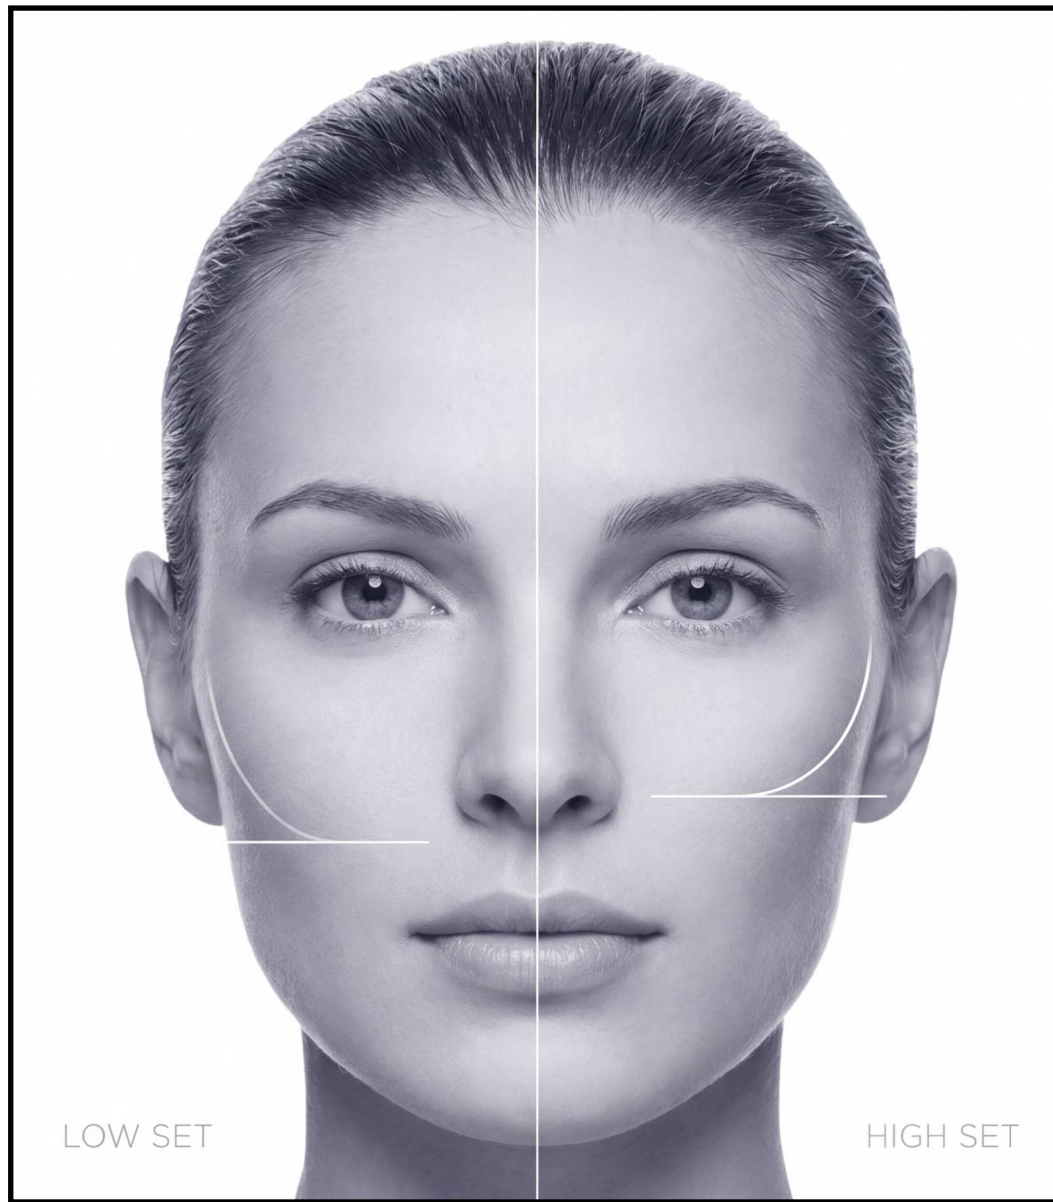

- They meant you could eat. Powerful chewing muscles are anchored to strong zygomatic arches. Weak cheekbones meant you starved.
- They were your face's armor. They shielded your eyes, nose, and teeth in a fight or fall.
- They were your first social network. Micro-movements in your cheeks communicated trust, threat, and intent long before speech.
- They broadcast your health. Good circulation in the midface signaled vitality and strong genetics.

Chapter 5: The Cheeks

High Set Cheekbones

Cheekbone position is largely genetic.

Some faces are built with high, prominent cheekbones that create natural lift and sharpness. Others have lower-set cheekbones, where the midface appears flatter or

LOW SET

HIGH SET

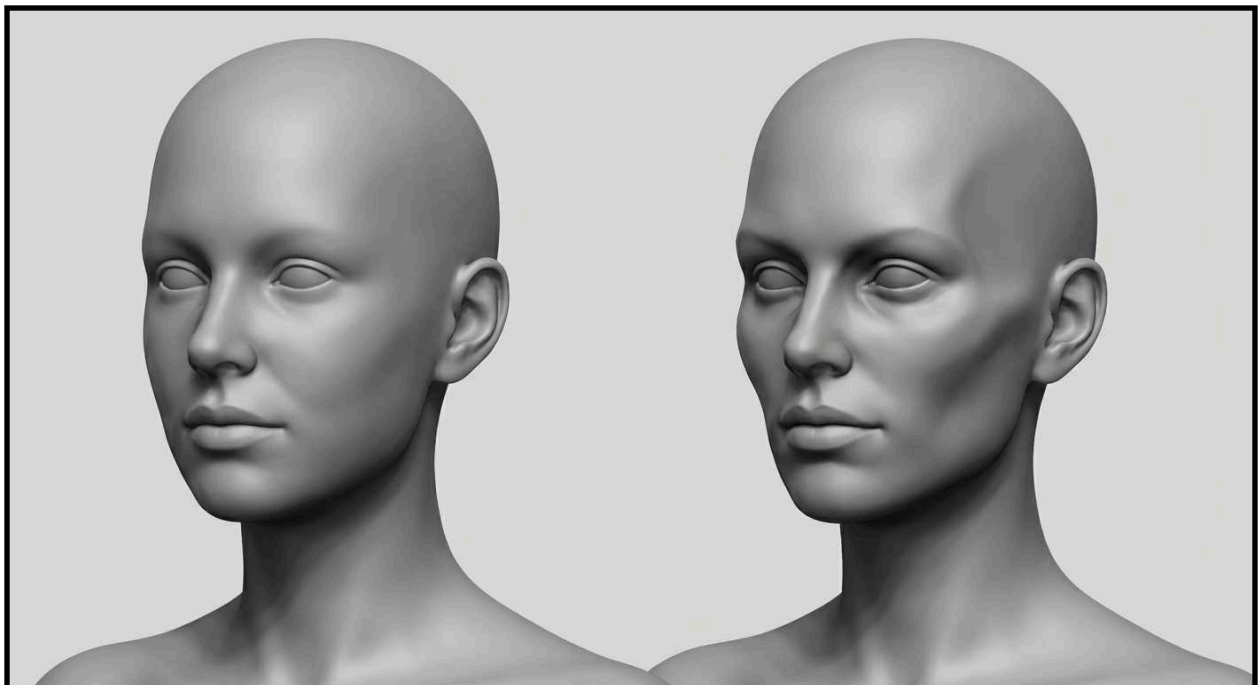

heavier.

This difference is structural—but not final.

High cheekbones are often associated with youth, definition, and facial strength. Lower cheekbones, by contrast, can reduce visible structure and make the face appear less elevated.

You are not changing your bones.

You are changing how your face expresses its structure. By developing the musculature of the cheeks, we create angles.

The Zygomatic Muscles

The most important muscle for this is the zygomaticus major.

It runs from the cheekbone to the corner of the mouth, and its primary function is to pull the mouth upward and outward—like a smile.

But beyond expression, it does something more important: It supports and lifts the mid-face.

Muscular Exercises

5.1 - Working the Cheeks

Zygomaticus

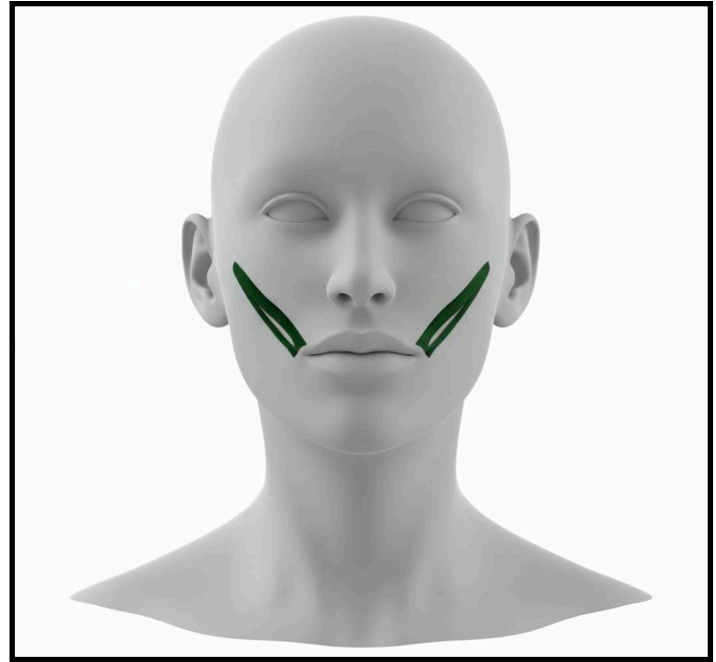

Major

Resistance

Smiling

Place oil on your fingers and then gently rest them on the corners of your mouth. Smile upward and outward as

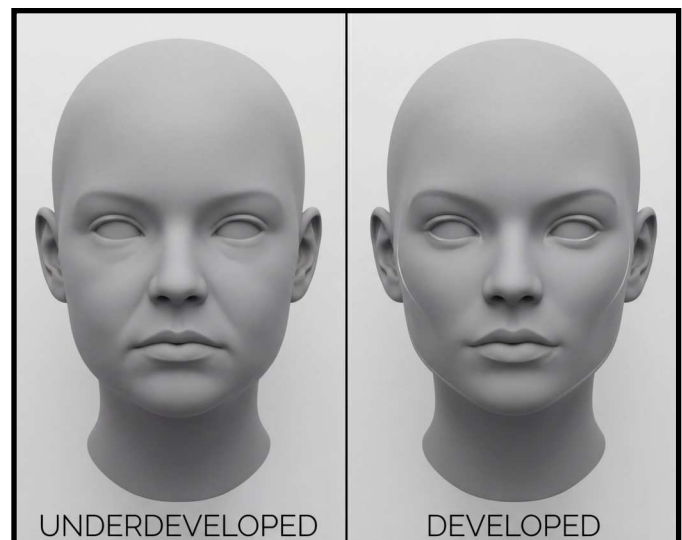

widely as you can against the resistance of your fingers. Focus on feeling the contraction in your cheekbones.

50 times

OPERATOR NOTES: PLACE OIL ON YOUR LIPS SO AS NOT TO CRACK THEM. ENSURE YOU'RE LIFTING THE CORNERS UP TOWARD YOUR EARS, NOT JUST PULLING THEM BACK. THIS WILL GIVE YOU "BIGGER CHEEKS", IT WILL NOT RAISE THEM UP, BUT DON'T WORRY, IT'S A PART OF THE PROCESS.

What This Does:

Smile Down

Clench your jaw tightly. Place three fingers under the Zygomaticus Major muscle, just under the cheek and push up with your fingers, then use your muscle to “push down” from your eyes towards the jaw.

Reps: 50 times, take a break, do it 50 more times, another break

OPERATOR NOTES: PUT OIL UNDER THE EYES SO YOU DON'T STRETCH THAT PART OF THE SKIN TOO MUCH. YOU WILL FEEL THE CHEEKS “EXTENDING OUT”, THIS IS GOOD. KEEP IT GOING, YOU REALLY SHOULDN'T SEE MUCH MOVEMENT BUT TRUST ME, YOUR CHEEKS ARE GETTING A WORKOUT.

What This Does:

Cheekbone Lift

Isometric

Smile without showing your teeth (a "Mona Lisa" smile).

Place your fingertips on your cheekbones and press down gently. I use my palms for more pressure. Try to lift your cheekbones upward against the resistance.

Repeat x50 times

OPERATOR NOTES: THIS IS TIRING AND BETTER THAN RESISTANCE SMILING EXERCISE. IT WILL TAKE A VERY LONG TIME TO SEE RESULTS, DON'T EXPECT ANYTHING OVERNIGHT. CREATES BIGGER CHEEKS.

NYX DIRECTIVE

Zygomatic Major Move - Advanced

Don't place any fingers on your face, don't move anything. Look in front of the mirror, then "move" the zygomatic major muscle. You will feel it tense up, perhaps your eye might twitch. This is only once you have mastered the muscle and can feel

and move it without doing anything.

Repeat x100 times or as many times as you can

"Double Smile" Hold

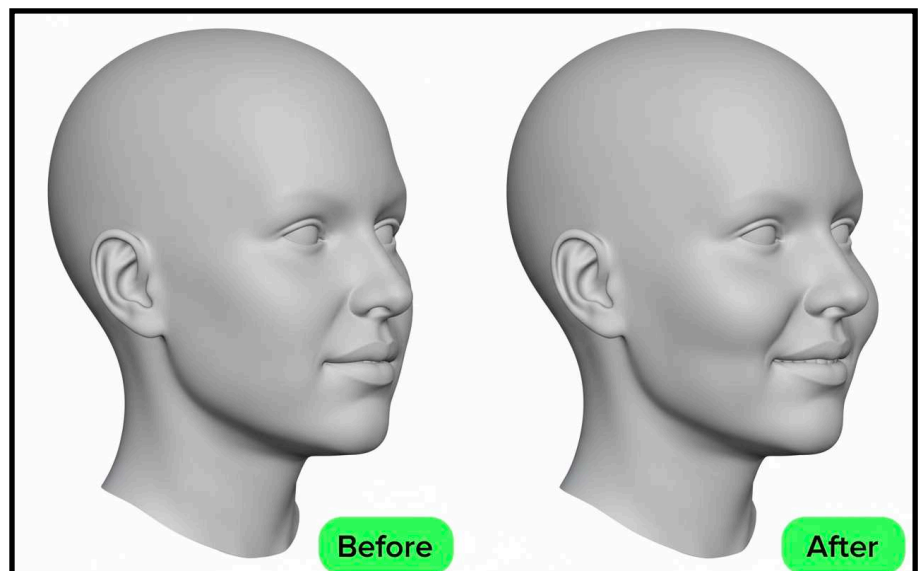

Place fingers on the side of your face or on the side of your cheeks. Create a small, closed-mouth smile. Then, widen it into a full, teeth-showing grin. You should be “pushing out your fingers”. Then release or alternatively you can hold the full grin for 3 seconds, and push against it. You are also able to use your palms for more pressure.

Start at x20 times, relax and do x20 more times

OPERATOR NOTES: I CAN'T RECOMMEND THIS ENOUGH, IT RELAXES THE MUSCLES SO WELL AND FORMS AN INSTANT LINE ACROSS THE CHEEK, VERY VISIBLE. THIS WILL “PUSH YOUR CHEEKS” OUT, SO IT CREATES A MORE ANGLED LOOK.

What This

Does:

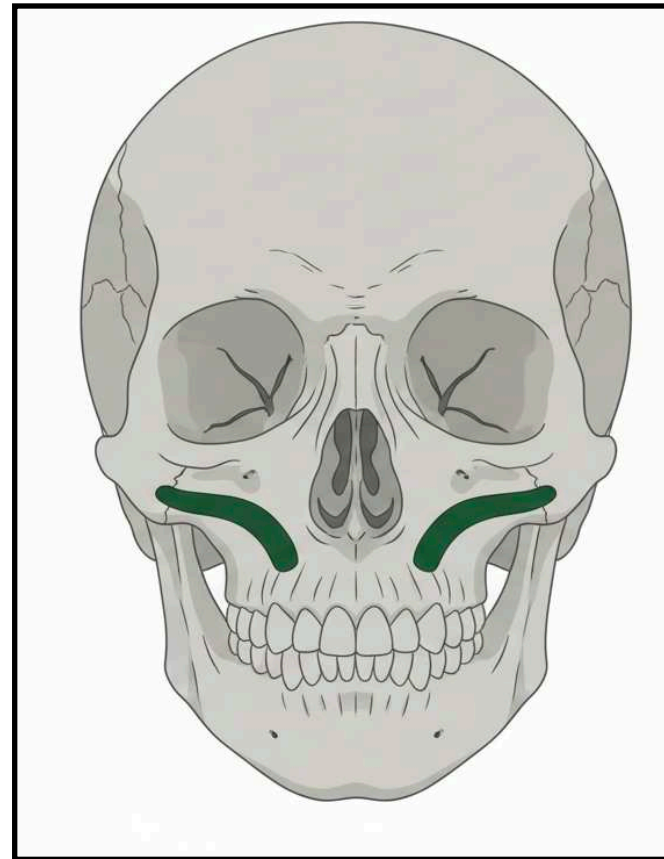

5.2 - Sharpening The Cheeks

Zygomaticus Minor

This muscle runs from the zygomatic bone (cheekbone) down to the middle of the upper lip. Its primary job is to lift the upper lip upward and slightly outward. It's active in:

- Expressions of sadness, contempt, or disdain.
- Refined, subtle smiling (working with Zygomaticus Major).
- Deepening the nasolabial fold (the smile line from nose to mouth).

Resisted Upper Cheek Lift

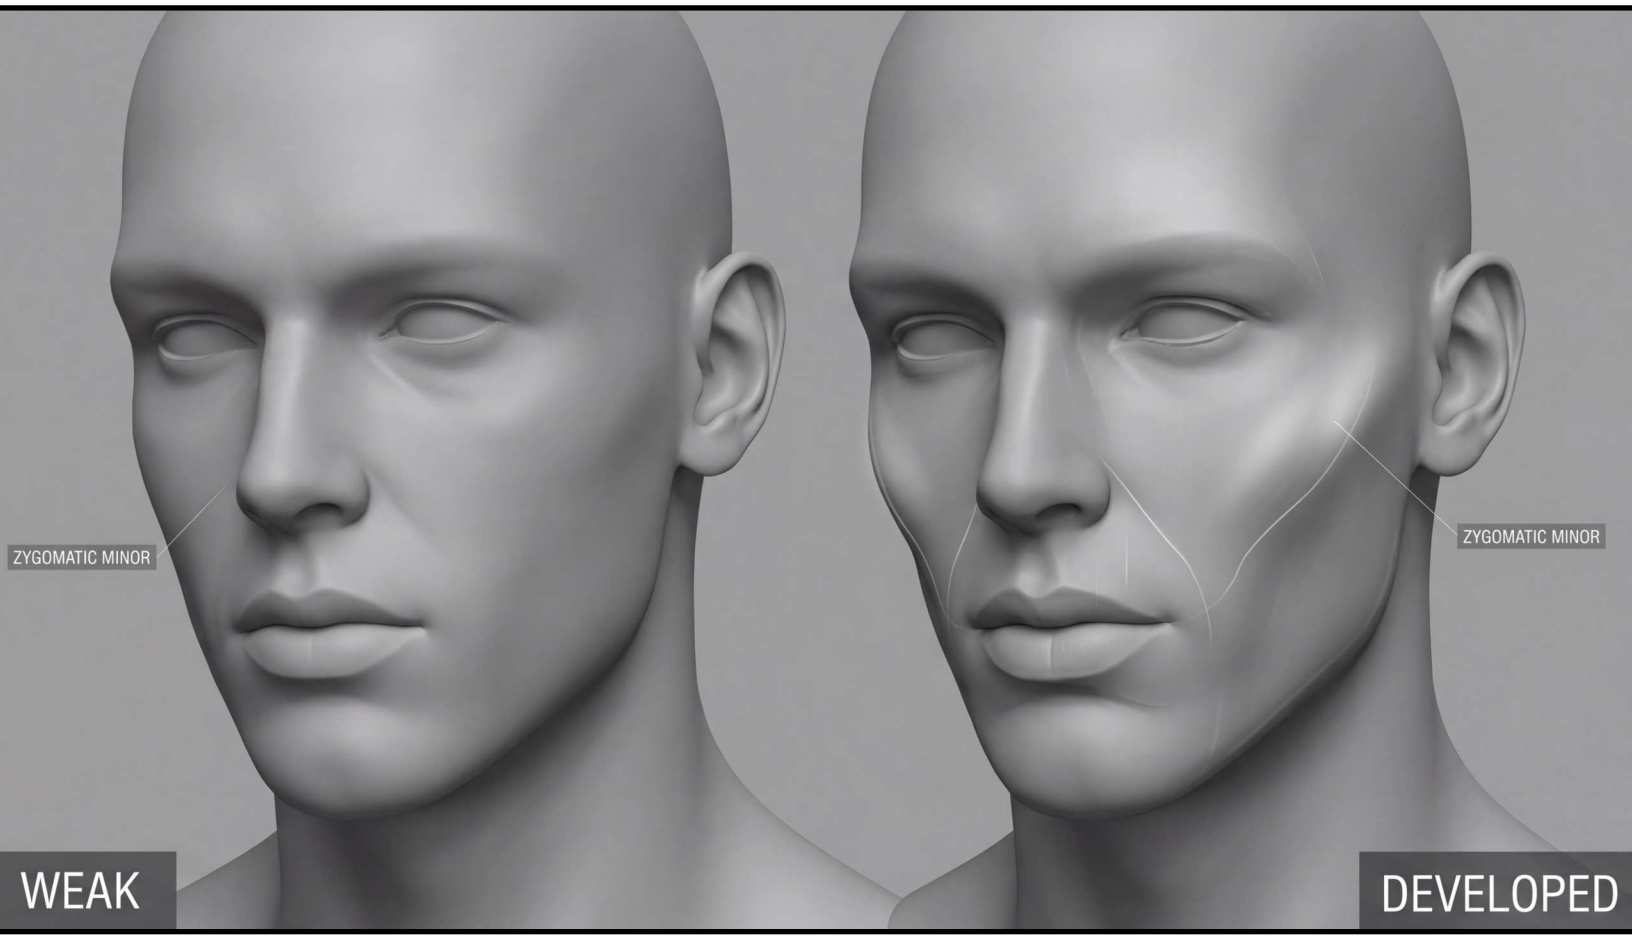

Place two fingers just under the eyes, push out against the resistance using the upper cheek muscles. You should feel this muscle.

X50 Times

Eventually x100 as you become more advanced

OPERATOR NOTES: THE ZYGOMATIC MINOR CAN TAKE A TOUGH WORKOUT AND A LOT OF PRESSURE, FEEL FREE TO REALLY WORK THIS MUSCLE OUT. THIS MUSCLE IS THE KEY TO GETTING “SHARP CHEEKS” AND THIS WORKOUT IS THE BEST ONE THERE IS.

What This Does:

Resisted Upper Lip Lift

Place your oiled index fingers horizontally just above your upper lip, right under your nose. Apply gentle downward pressure with your fingers. Now, try to lift only your upper lip straight up against this resistance, as if you're showing your top teeth or smelling a subtle flower.

Repeat 20 times

Crucial Tip: Try to keep the corners of your mouth relaxed. The movement should be focused on the center of your lip. Hold the contraction for 5 seconds.

"Subtle Snarl" Isometric Hold

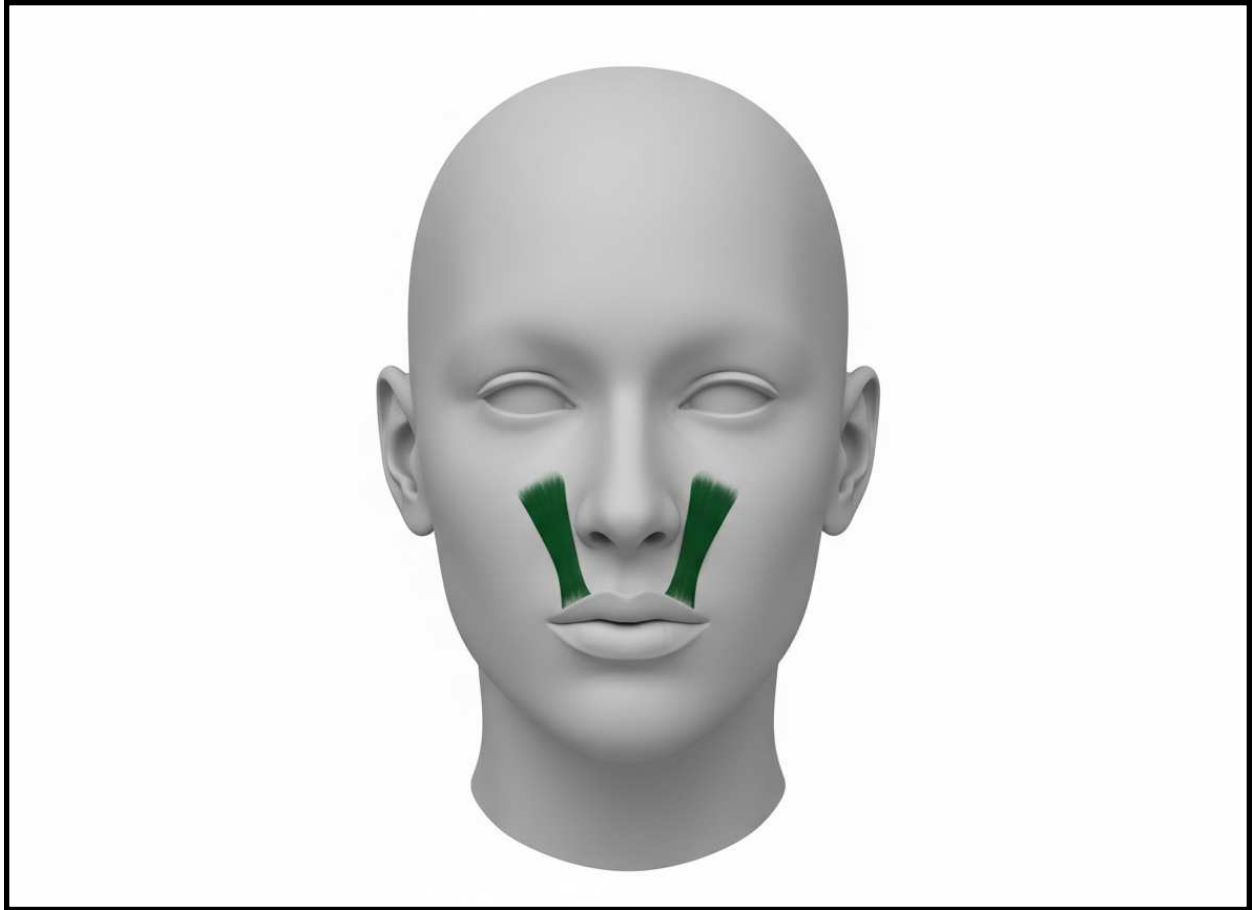

Lift your upper lip about halfway, without showing your teeth. Then push up without pressure. Hold this subtle, controlled contraction for 10 seconds.

Repeat x50 times

Eventually do up to x100 times

Great exercise, will also change the shape of your nose making it shorter due to how the muscle fibers are connected.

Levator Labii Superioris

Helps create an “angled” face, makes the face look much younger, gets rid of wrinkles and even helps breathing, a totally underworked muscle. Perhaps the 2nd most important muscle to work out after the zygomaticus major.

Function of the Levator Labii Superioris

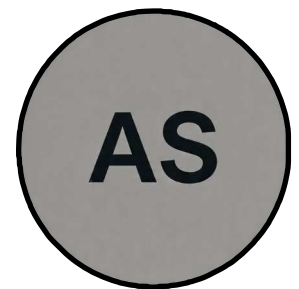

Location: Runs from the upper cheekbone (just below the eye) down to the upper lip.

What it does: It's the primary muscle for expressions like:

- Snarling (showing your top teeth).
- Contempt or disdain.
- Intense smiling (in combination with the zygomaticus muscles).

Resisted Snarl (The Best Exercise)

Place your index fingers just above your upper lip, providing gentle downward pressure. Slowly snarl—lift your upper lip and nose upward as high as you can, against the resistance of your fingers. Focus on isolating the movement to your upper lip and the area beside your nose. Avoid squinting your eyes. Hold the contraction for up to 5 seconds.

Repeat x30 times,

Then do x50 times once you're comfortable

OPERATOR NOTES: FEEL FREE TO DO ONE SIDE IF THE OTHER SIDE FEELS STRONGER. YOU CAN ALSO ALTERNATIVELY JUST HOLD IT, FOR MY WEAKER SIDE I WILL HOLD ONE SIDE FOR UP TO SIXTY SECONDS. THE GOAL IS TO DEAL WITH MUSCLE IMBALANCES. THIS EXERCISE WILL ALSO HELP YOU BREATHE EASIER AS IT OPENS UP THE NASAL CAVITY.

What This Does:

"Rabbit Nose" Wrinkle

Imagine you have a funny smell. Wrinkle your nose and lift your upper lip rapidly. Really wrinkle the nose and even the eyes, lift it up.

Aim for x100, you can do this many times

OPERATOR NOTES: THIS ISOLATES THE LLS AND THE ASSOCIATED LEVATOR LABII SUPERIORIS ALAEQUE NASI MUSCLE (WHICH ALSO FLARES THE NOSTRILS). THIS WILL CAUSE WRINKLES UNDER THE EYES AND PERHAPS MICRO-WRINKLES ON THE NOSE, BUT STILL A USEFUL EXERCISE.

Isometric Lip Press

Press your upper lip firmly down against your top teeth. "Suck it in", then lift up with your cheeks, you'll feel this muscle. While pressing down, try to lift the lip upward against itself (an isometric contraction). You can use oiled fingers but they don't really help.

Try x20 times, you'll tire quickly, take a break and try x20 more

Eventually work up to x50 times

OPERATOR NOTES: AWESOME EXERCISE, YOU FEEL THE BURN, YOU GET TIRED QUICKLY AND IT TAKES VERY LITTLE TIME. LOTS OF REWARD FOR RELATIVELY LITTLE EFFORT. ALL THESE EXERCISES WILL “PUSH” THE CHEEKS FORWARD.

What This Does:

5.3 - The Minor Cheek Muscles

Levator

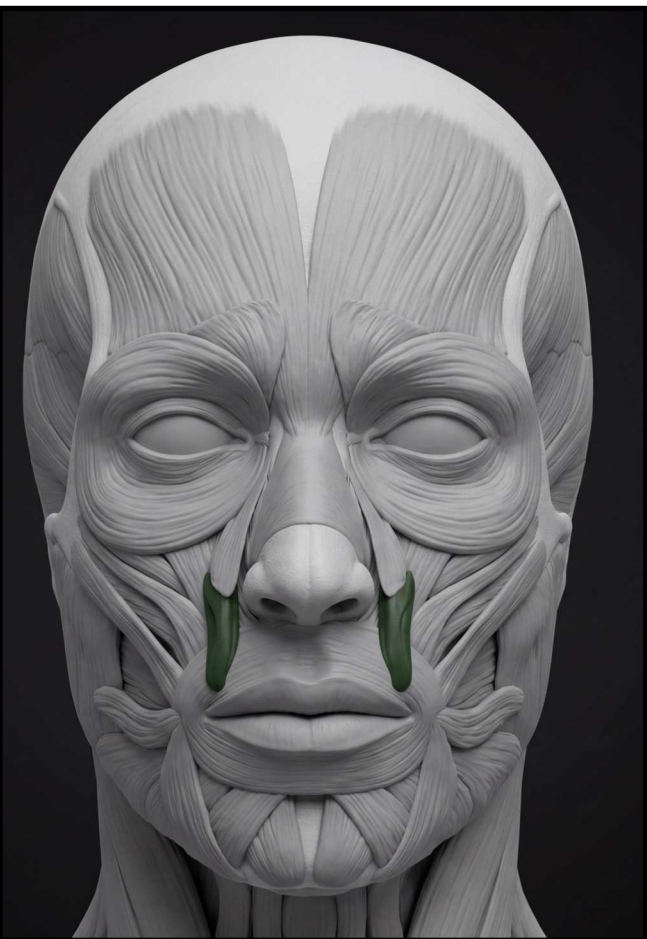

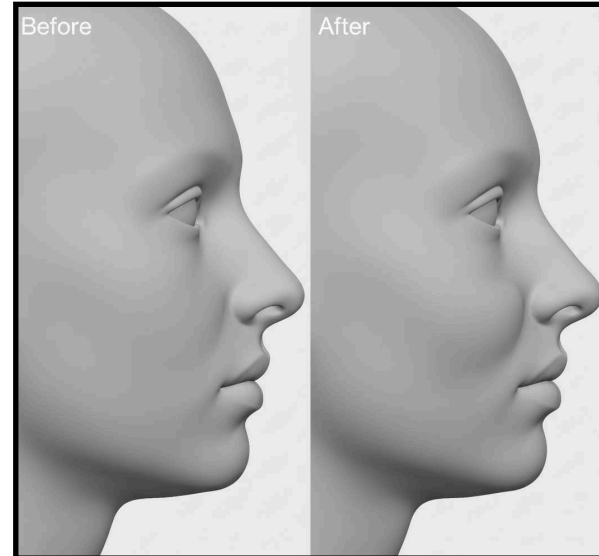

Anguli Oris

Function of the Levator Anguli Oris (LAO)

Location: A deep muscle that runs from the canine fossa (a depression in the maxilla bone below the eye socket) to the angle (corner) of the mouth.

Primary Action:

Elevates the angle of the mouth

upward and slightly inward. It is a key component of a true "Duchenne" smile (the genuine smile that reaches the eyes and creates crow's feet), working in harmony with the zygomaticus major and orbicularis oculi.

Resistance Smile (Corner Lift)

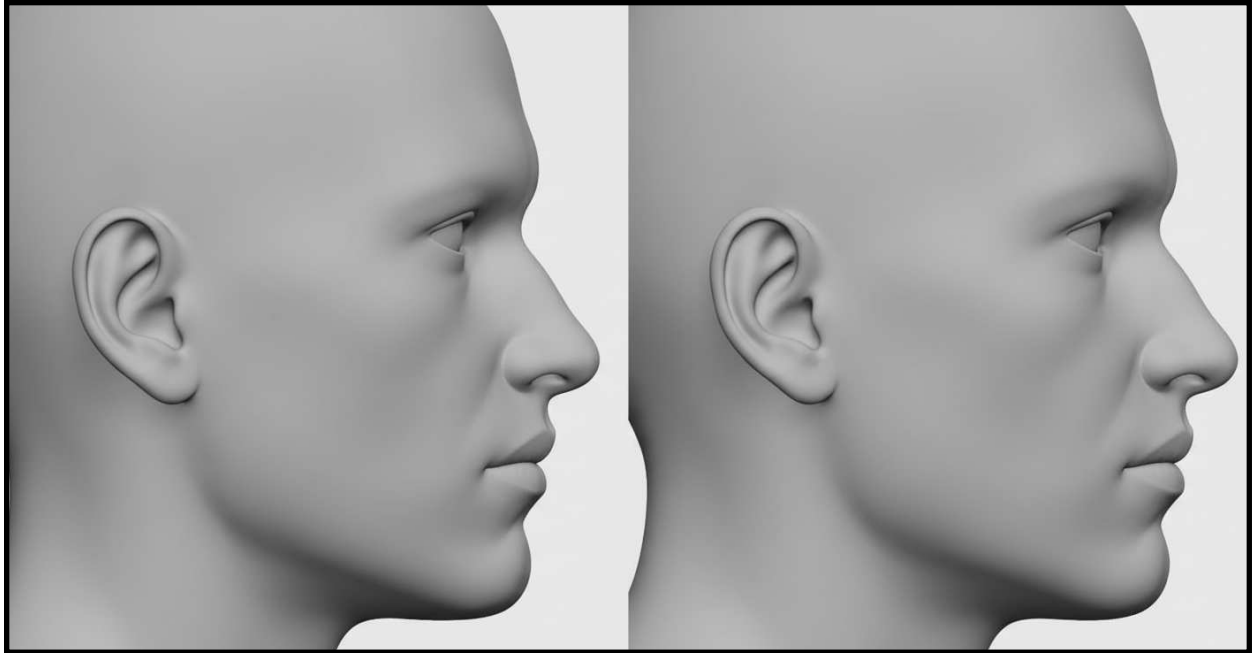

Place your index fingers directly on the corners of your mouth. Gently press downward and slightly outward with your fingers. Now, try to smile upward against this resistance, focusing on lifting the mouth corners straight up toward your eyes. Hold this resisted smile for 5-10 seconds. Completely relax your face.

Try x20 times, you'll tire quickly, take a break and try x20 more

Eventually work up to x50 times

OPERATOR NOTES: HELPS CREATE AN ANGLED FACE, AND WILL PUSH THE CHEEKS FORWARD.

What This Does:

"Heartfelt Smile" Isometric Hold

Create a genuine, closed-mouth smile (think of something that makes you happy). You should feel a contraction in the apples of your cheeks and a slight pull toward your eyes. Focus on pulling up to your eyes with your cheeks.

Repeat x100 times

OPERATOR NOTES: ONCE YOU GET EXPERIENCE YOU CAN PLACE YOUR FINGERS ON YOUR CHEEKS FOR MORE TENSION. FOCUS ON SLOW, FOCUSED, REPETITIONS, BRINGING THE MUSCLE ALL THE WAY DOWN. DON'T RUSH THIS, DO LESS BUT MORE SLOW REPETITIONS IF YOU GET TIRED.

Unilateral (One-Sided) Corner Lift

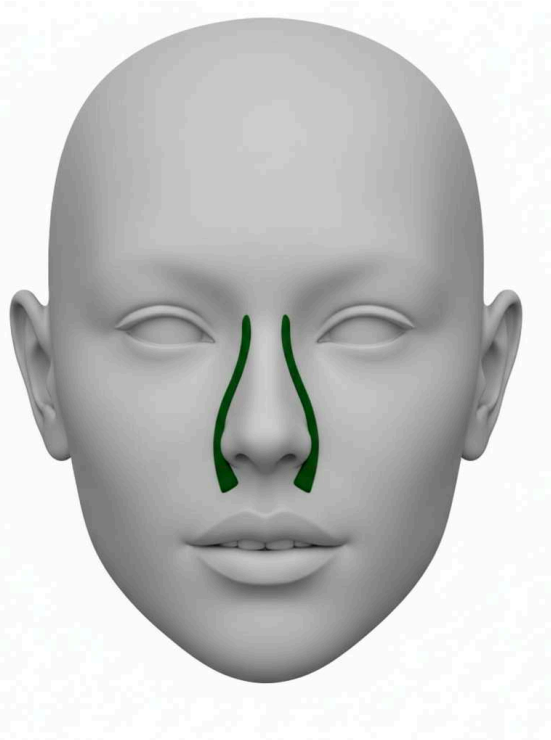

(Excellent for correcting asymmetry). Our faces are asymmetrical because we tend to chew on one side more. Focus on one side of your mouth. Place a finger on the corner you want to lift. Isolate the movement and try to lift only that corner upward. This is purely to fix asymmetrical cheeks.

X25 times

Levator Labii Superioris Alaeque Nasi

Location: It originates near the inner corner of the eye socket and attaches into two places:

The upper lip (like its name suggests).
The ala (wing) of the nose.

The "Elvis Sneer" (The Primary Exercise)

Sit in front of a mirror with a neutral face. Isolate and lift your upper lip straight up as high as you can.

Simultaneously, flare your nostrils. Make sure to hold your brow and forehead up with your fingers, as this exercise will cause a deep wrinkle between your nose and brows. Hold this combined "sneer" for up to 5-10 seconds.

Try x25 times the first time then work your way up to x50 times

AS YOU GET BETTER YOU CAN USE FINGERS ON YOUR CHEEKS TO ADD MORE WEIGHT AND RESISTANCE. THIS EXERCISE HELPS STICK OUT THE NOSE AND RAISE THE CHEEKS.

What This Does:

Resisted Nostril Flare

Place your index fingers gently on the sides of your nostrils. Try to flare your nostrils against this light resistance. As you flare, focus on also lifting your upper lip slightly. Hold for up to 5 seconds, then relax.

X25 times then work up x50 times

Massages

5.4 - Cheek Massages

Take your fingers (with oil) and rub across the nasal fold lines vertically, do x100 times. Gets rid of the strong line you will develop after working the cheek muscle

where the cheeks meet the mouth.

With three fingers push up and use the other fingers to pull across the whole cheek, don't do the eyes, we're focusing on the cheeks here. Pull across with well oiled fingers and cheeks, will help pull the tissue, creating a tight cheek look. Go for 100 times - each side.

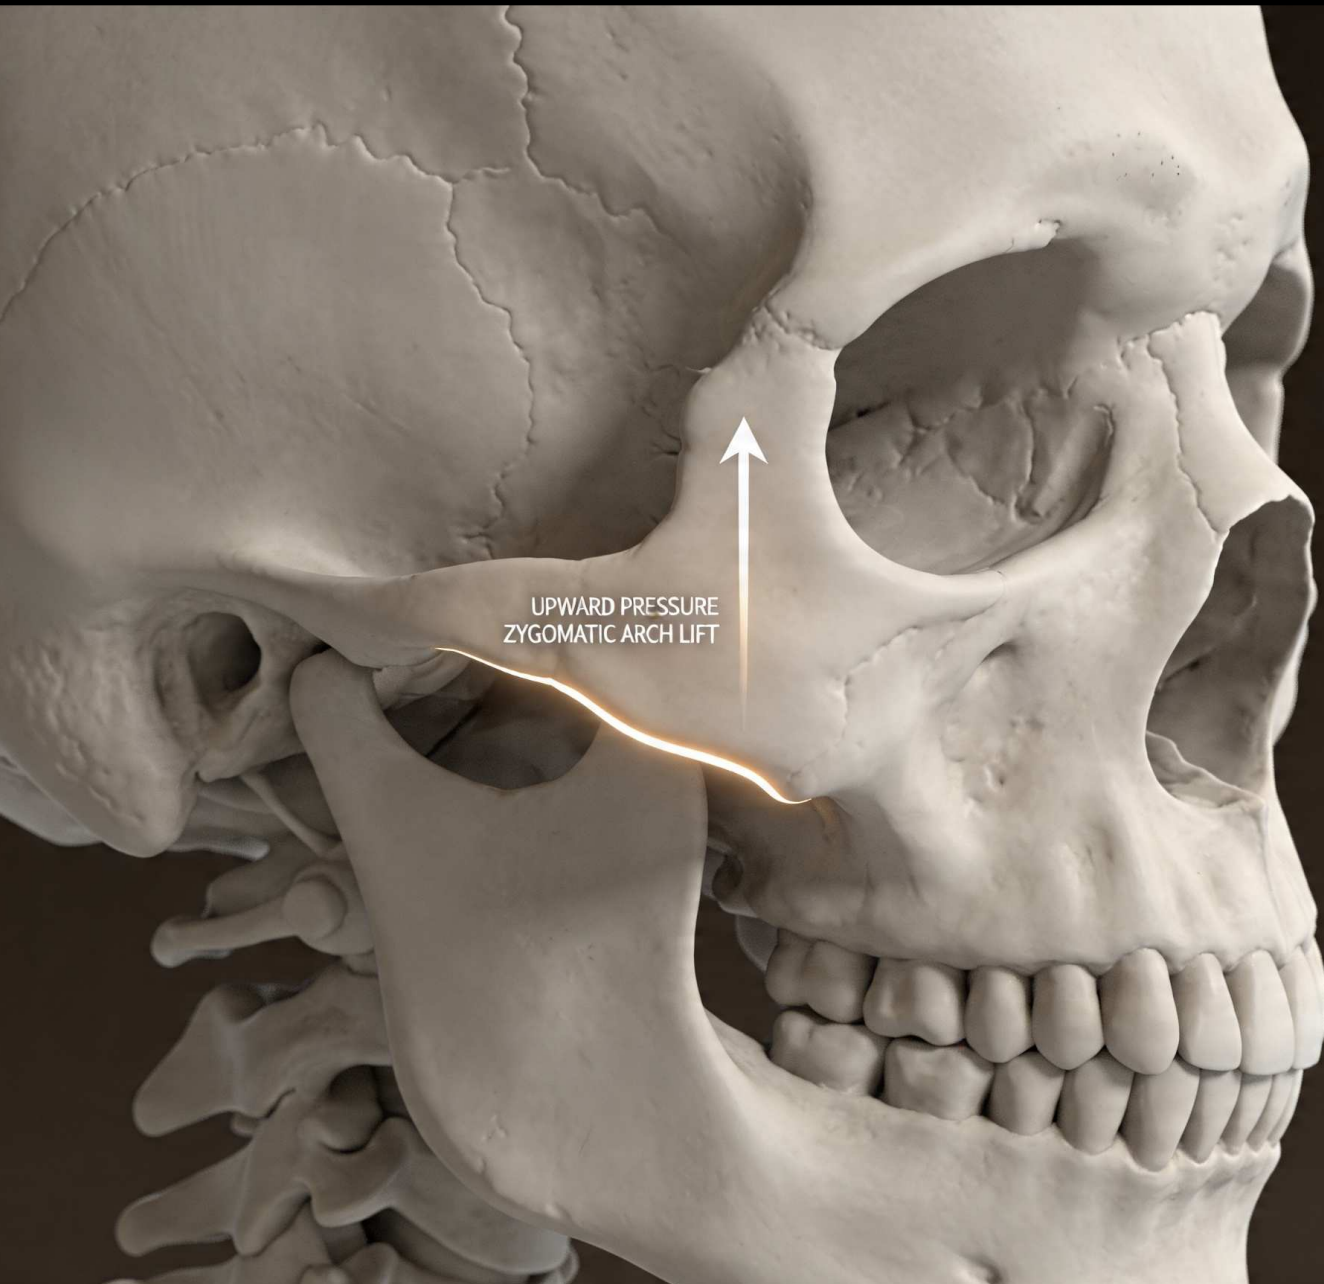

Refinement

NYX DIRECTIVE

Zygomatic Arch Lift

Observe the bones of the skull. Look at the Zygomatic bone in the middle, see how it sticks out? Well, we're going to up our fingers, place

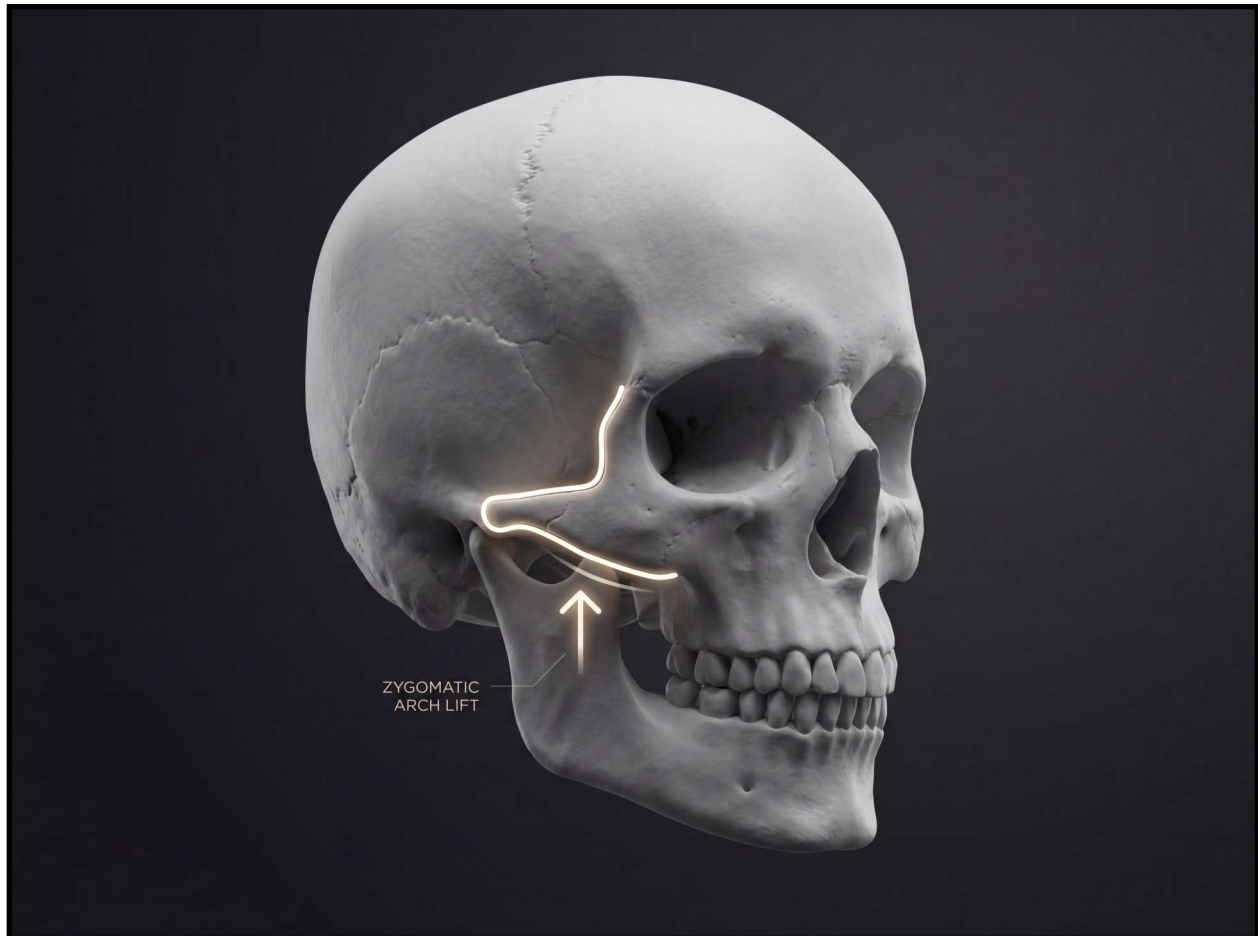

it under that bone and “push up”, start at ten seconds and work up to 60.

This is what pushes up the cheek bones. I do it under the eyes, to the side and all the way out. I do it in three sections. Will take lots of time and patience.

OPERATOR NOTES: THIS CAN HURT AND THAT’S OKAY, BUT IF IT STARTS TO FEEL REALLY PAINFUL, STOP RIGHT AWAY. WE WANT, VERY, VERY LITTLE SLOW

PROGRESS THAT IS SAFE. THIS WILL TAKE MANY MANY TIMES TO SEE RESULTS BUT IT WORKS.

Our last sets will push the very side of that bone. We want to push it up.

You can see that thin strip on the side, push that up, hold it. Up to sixty seconds.

The Forehead: Your Silent Social Signal

Your forehead is a powerful communication panel, second only to your eyes.

In a flash, it can reveal doubt, stress, youth, or total authority. It's why people instinctively trust—or distrust—a face before a single word is spoken.

From a primal standpoint, your forehead was a non-negotiable social tool:

This is where presence is built.

Chapter 6: The Forehead

6.0 - Developing a Prominent brow

Muscular Exercises

Corrugator Supercilii

The Corrugator Supercilii is a small, narrow muscle located deep beneath the eyebrows, at the inner corner of

the brow ridge. It's the primary muscle responsible for frowning, creating the vertical "11" lines between the eyebrows.

Resisted Frown

Place your index fingers horizontally across the inner corners of your eyebrows. Gently try to frown, pulling your eyebrows down and together against the resistance of your fingers. Crucially, completely relax the muscle fully after each repetition.

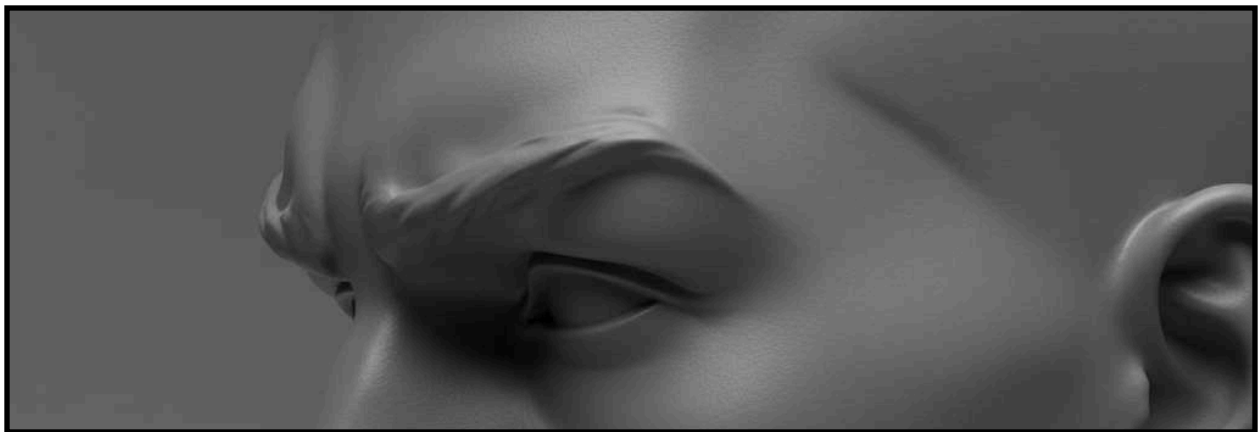

X25 Beginner

X50 Intermediate

X70 Expert

OPERATOR NOTES: THIS WILL CREATE WRINKLES BETWEEN YOUR BROWS, YOU WILL HAVE TO DO MASSAGES TO GET RID OF THOSE WRINKLES. BUT IT WILL CREATE A PROMINENT BROW.

What This Does:

Eyebrow Push Down

Place fingers under the brow, push down. Alternatively only one side can be pushed down if you feel you have a weak side. You can also alternatively push up.

Experiment.

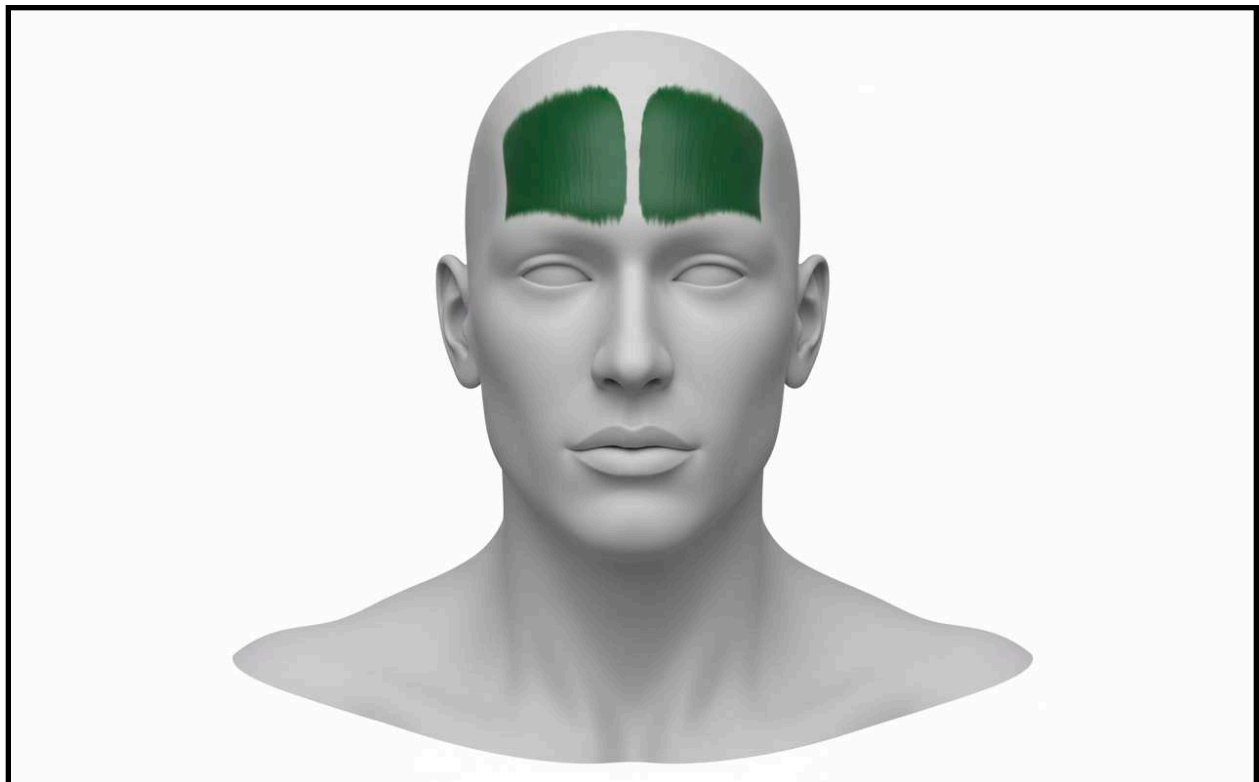

X20 Beginner

X30 Intermediate

X50 Expert

X100 Master

Frontalis

Frontalis (Frontal Belly of Occipitofrontalis)

- Raises eyebrows (e.g., surprise expression).
- Creates horizontal forehead wrinkles.
- Innervation: Temporal branch of facial nerve (CN VII).

Isolated Eyebrow Raises:

Sit in front of a mirror with a neutral face. Place your fingertips firmly on your temples and the sides of your forehead.

This prevents you from cheating by using other facial muscles. Slowly raise only your eyebrows as high as you can, feeling the stretch across your forehead. You can hold the raise for up to 5 seconds. Slowly lower them back down with control.

Sets of X20, take a rest and do multiple sets

OPERATOR NOTES: THE BEST FOREHEAD EXERCISE. IT WILL TAKE A LONG TIME TO TAKE EFFECT. TAKE DEEP BREATHS. THIS WILL TENSE UP THE NECK, FOR WHATEVER REASON. YOU SHOULD TAKE YOUR TIME AS YOU BECOME MORE AN EXPERT IN THIS EXERCISE, I USED TO MAKE VERY SUDDEN AND RAPID MOVEMENTS AND NOW I SIMPLY FOCUS ON HOLDING MY HANDS UP, AND SLOWLY RELAXING AND DROPPING THEM DOWN SOLELY THROUGH THE EFFORT OF MY FRONTALIS.

What This Does:

Forehead Palm Resistance

Place the palm, well oiled on the forehead, lift up. Change palms every x25 times or every x10 times. Do not try to use the eyebrows, as you get stronger you will see your palm visible moving.

X20 Beginner

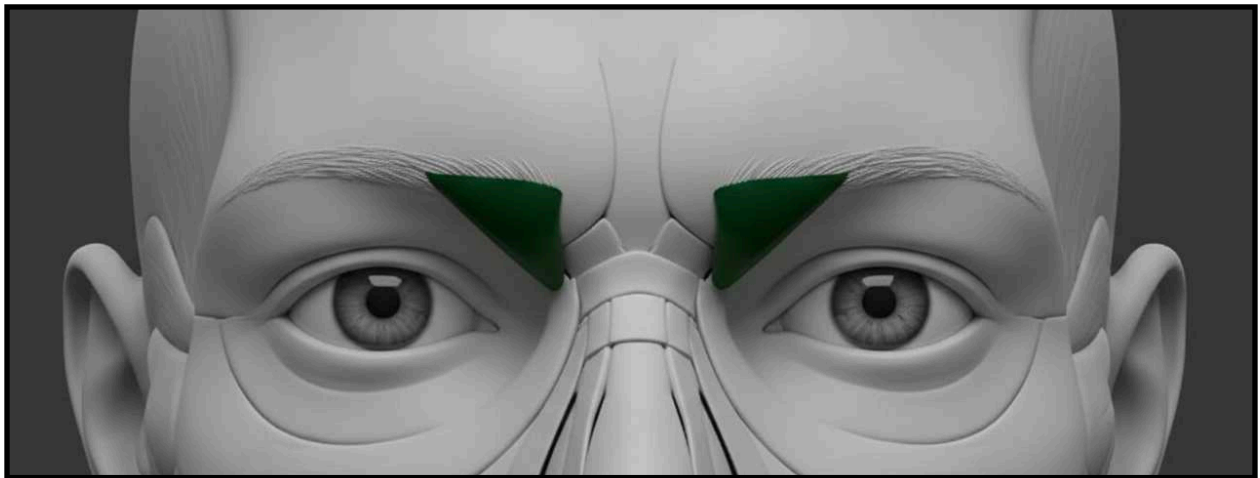

X50 Intermediate

X100 Expert

OPERATOR NOTES: THIS WILL MAKE THE BROW MUCH MORE PROMINENT, PERHAPS EVEN TOO MUSCULAR BUT IT'S WORTH IT.

6.1 - The Inner Brows

Depressor Supercilii

Location:

Lies beneath the orbicularis oculi and corrugator supercilii, at the medial (inner) end of the eyebrow.

Action:

Pulls the inner eyebrow downward (contributing to a furrowed or "sad" expression).

Inner Brow Resistance

Place two fingers on each side against the inner brow, push inward and resist. Return to the starting position.

X20 Beginner

X50 Intermediate

X100 Master

Upper Brow Resistance

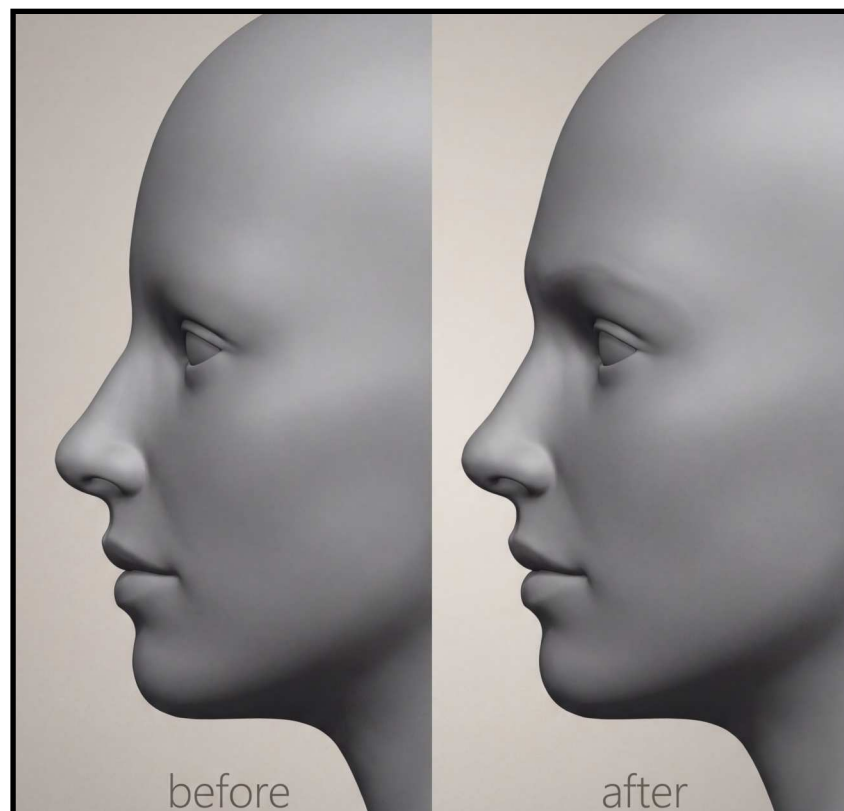

Place your fingers in a parallel version above your brows, lift your brows up and resist the motion.

X50 Times

OPERATOR NOTES: WILL CREATE A POWERFUL INNER BROW FOR A MORE ANGLED FACE. WILL LEAD TO WRINKLES.

What This Does:

Massages

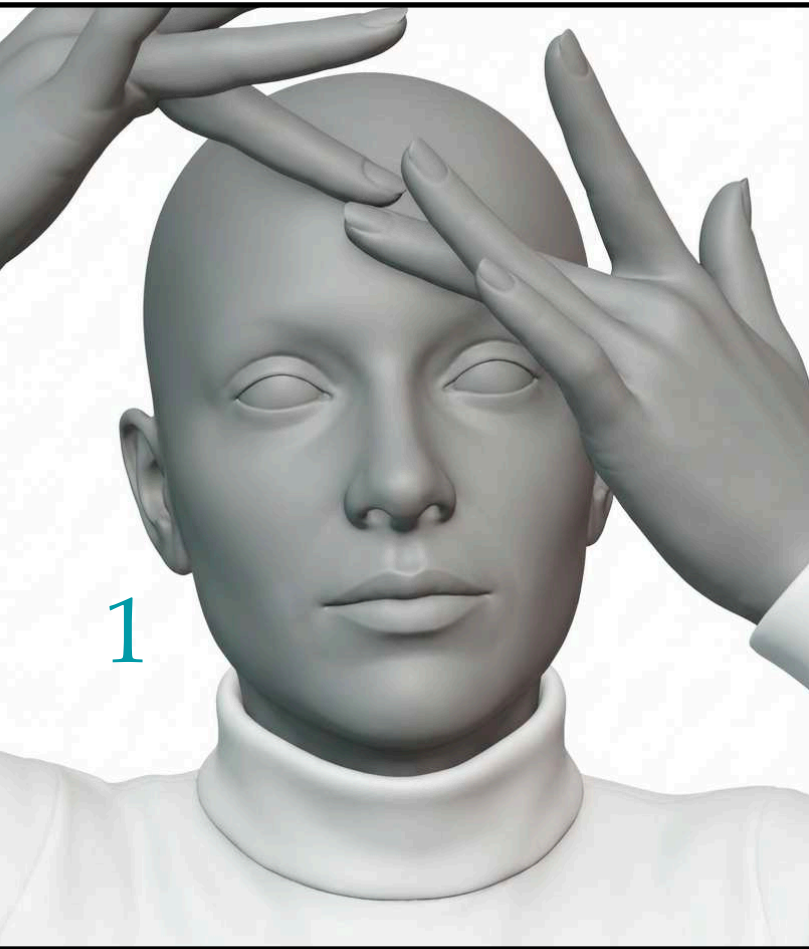

6.2 - Forehead Massages

1. Rub across in a switching motion with fingers to tear into the wrinkles (x50). 2.

Just rub your fingers horizontally across the forehead up to x100 times.

3. Use one hand to stretch the forehead then use knuckles or fingers to

“pull” across the forehead and remove those wrinkles
(x50)

Use oiled fingers to grab each side of the wrinkle and pull up and down at the same time. Repeat x50

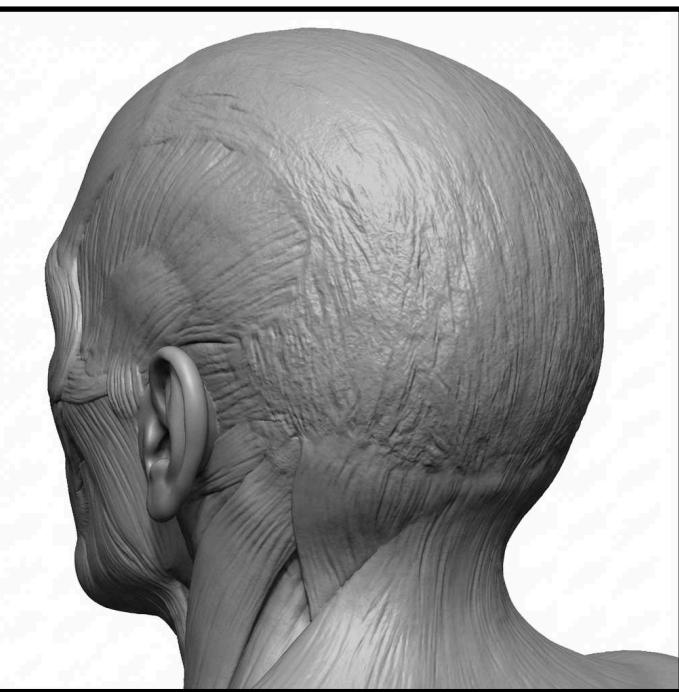

times.

Use oiled knuckles and pull the forehead apart, x50 times or x100, depending on how much work you want to do. Pull apart from both sides equally.

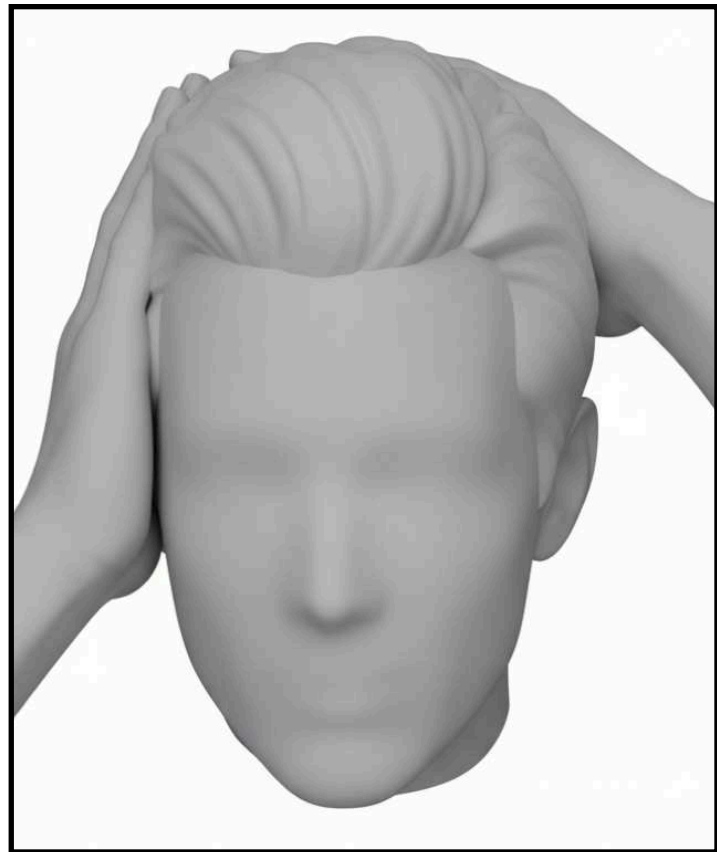

Refinement

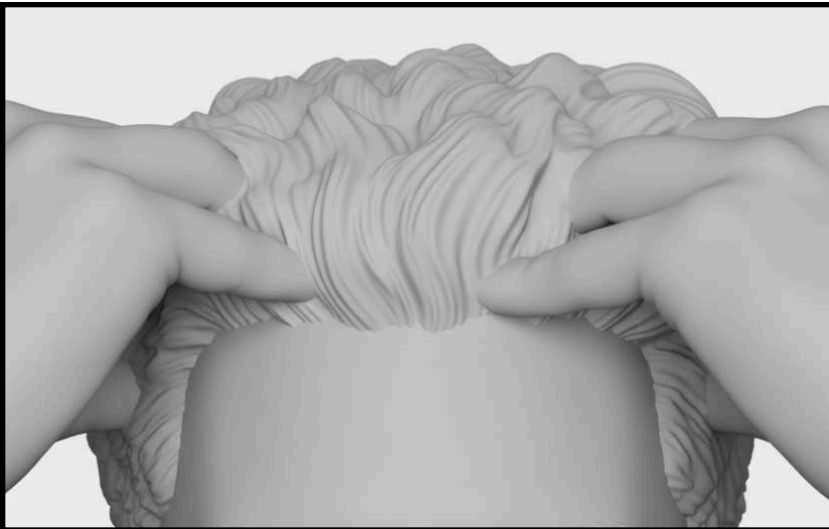

6.3 - The Scalp & Hair

The scalp does not have any muscles, which seems strange but it's true. The scalp is made of hard connective tissue. This tissue is called the "Epicranial Aponeurosis", it is basically dead tissue. We cannot "workout" this tissue as it is not a

muscle. All we can do is pump more blood to it and "toughen it up".

Grab various parts of your forehead and move the tissue around, use your palms and make sure your palms are oiled so the oil soaks into the scalp, I prefer Jojoba oil. Move that tissue, feel it move and feel the blood come to your scalp. This will not help your hair regrow, only a doctor can do that, but it will help your hair grow thicker.

Using your fingers, dig into the scalp (don't use nails obviously) and make sure you fingers are well oiled and massage that tissue around. Crease it up, tense it up, push it

together and let it relax. This may make your scalp even itch with how much blood is going there. The best exercise to getting that beautiful long hair. Black castor oil also works.

Grab your hair and pull it gently, pull it different directions (if your hair is long enough). Some hair may fall out and this is perfectly natural. This will help toughen the connective tissue of the hair.

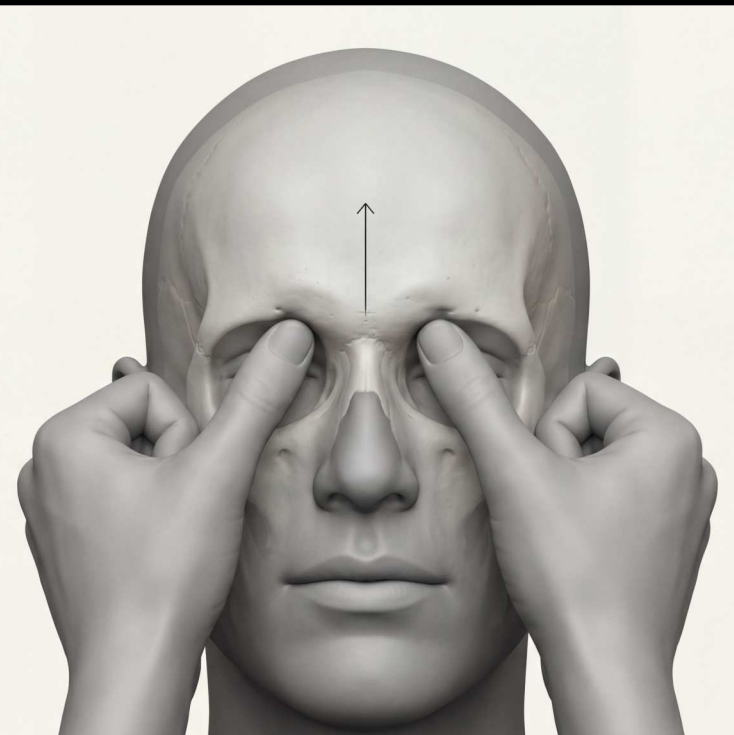

We want to do these exercises for two to five minutes for starters. Work your way up to ten minutes and eventually a maximum of twenty minutes.

OPERATOR NOTES: DO NOT OVERDO THIS, YOUR SCALP NEEDS A LITTLE WORKOUT, NOT A LOT.

NYX DIRECTIVE

Place your fingers under the brows, on the upper sockets of the eyes and push up. This will force the brow muscles up and create a

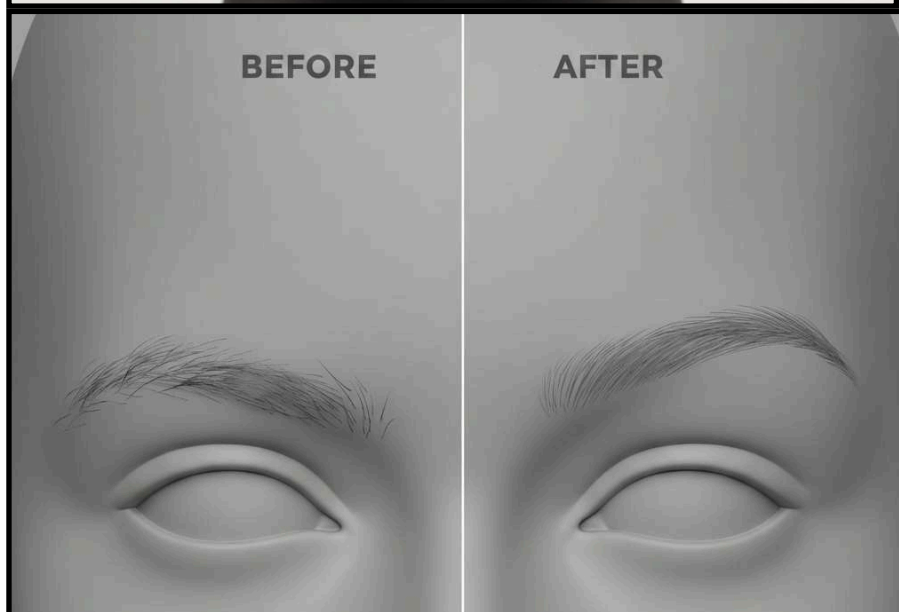

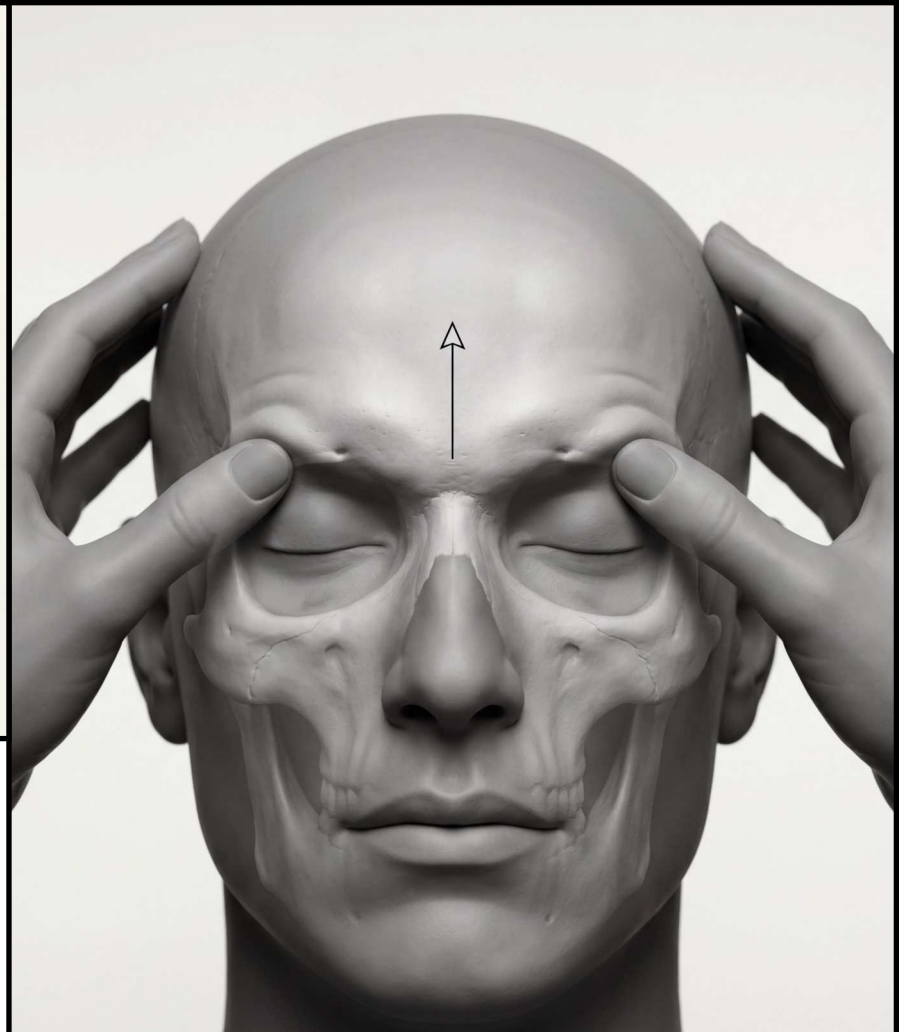

friendly looking
face. Start at ten
seconds, then twenty,
thirty, sixty and
eventually 100 seconds.

OPERATOR NOTES: I
PERSONALLY USE MY THUMBS
AND REST MY ELBOWS ON THE
DESK, ALLOWING MYSELF TO
CREATE A LOT OF PRESSURE.

*What This
Does:*

Eyebrow Pull

Pinch the brows and pull them forward all along the brows. Will thicken up the eyebrows.

X100 Times

NYX DIRECTIVE

De-Agerizer - You can only do this once you have sufficient strength in the forehead, don't bother trying before

Tuck your hands onto the edges of your brow and around your scalp so that the hands form a perfectly tight seal between the upper face and the edge of the hair. Pull the hands slightly apart as you shift your forehead around, so for a wrinkle across the line. The point is to keep that tight sea.

Step Two: Take your hands and place your fingers on the top and bottom of your scalp and stretch out and flex but

as opposed to pulling vertically (pulling the wrinkle apart from top to bottom) you're pulling the wrinkle across (so as to ease it out).

OPERATOR NOTES: IMAGINE SMOOTHING A DEEP CREASE IN A TAUT BED SHEET. YOU

DON'T PRESS ON THE CREASE ITSELF; YOU PULL THE FABRIC FIRMLY AROUND IT FROM MULTIPLE ANCHOR POINTS. YOUR HANDS ARE THOSE ANCHOR POINTS, YOUR SCALP IS THE FABRIC, AND YOUR FRONTALIS MUSCLE IS THE CREASE. BY PULLING THE SURROUNDING TISSUE TIGHT WHILE THE MUSCLE FLEXES, YOU TRAIN IT TO STRENGTHEN AND CONTRACT WITHOUT DRAGGING THE SKIN INTO A FOLD. THIS REQUIRES EXPERT-LEVEL CONTROL AND WILL FEEL UNNATURAL AT FIRST, BUT WITH REPETITION, THE MIND-MUSCLE CONNECTION BECOMES INTUITIVE.

The Nasal Anchor: Strength Over Style

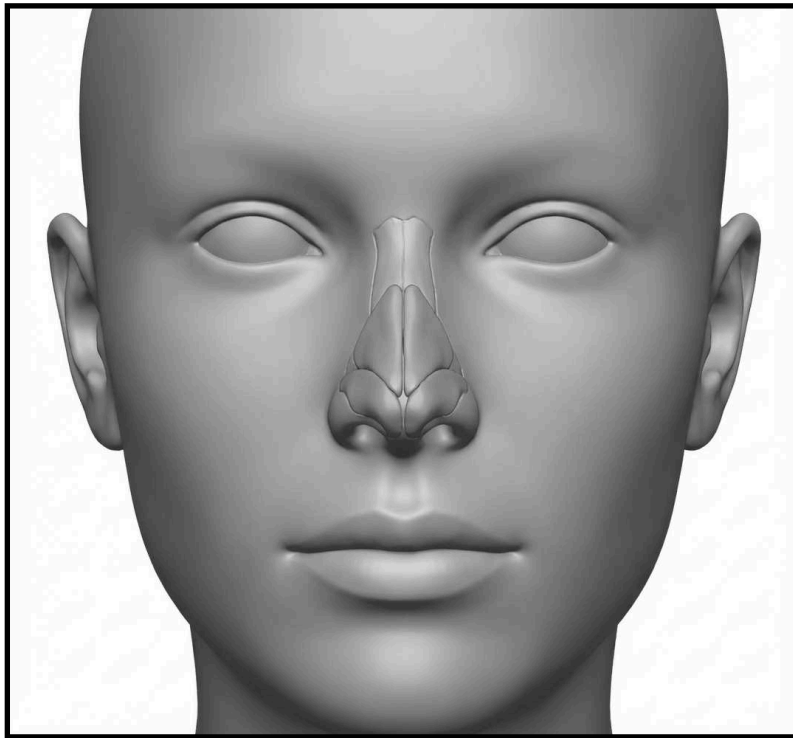

The “perfect” nose changes with the era—Roman admiration for a strong, crooked bridge, the Greeks loved a straight line, today’s preference is for a delicate, upturned tip.

But timeless beauty in a nose has nothing to do with the trend of the day. It’s not the bone structure. It’s the muscle, the fibers, the living strength beneath.

A strong nose is a resilient one.

It’s built to withstand impact and maintain its form. It’s supported by healthy, cultivated skin at the tip. I believe our modern environment—smog, pollution, allergens—actively weakens this structure.

Chapter 7: Modifying the Nose

7.0 - The Nose

The nose is a uniquely challenging feature to refine because it comes in such a wide variety of shapes and structures.

There is no single ideal; your nose is a fundamental part of your genetic heritage. While only surgery can alter its underlying bone and cartilage type, this does not mean you are powerless to improve its appearance and function.

Contrary to the common belief that the nose is a static structure, its form is not entirely fixed. The lower two-thirds of the nose are composed of cartilage, a pliable tissue that responds to sustained pressure over time—a principle demonstrated by practices like ear gauging. This reveals a key truth: while you cannot change your foundational bone structure, you can influence the supportive cartilage and muscular framework.

Therefore, your approach should be tailored. We will reference common nose typologies (acknowledging their imperfect origins) not to label, but to identify your starting point and the most effective focal points for your routine. Crucially, the core muscle-strengthening exercises remain the same for all types.

Why is this work essential? The nose is the central anchor and pivot point of your face. A weak or unsupported nasal structure contributes to a loss of midface tension, which can lead to the appearance of sagging cheeks and undefined contours. By strengthening the nasal and surrounding muscles, you fortify this crucial anchor,

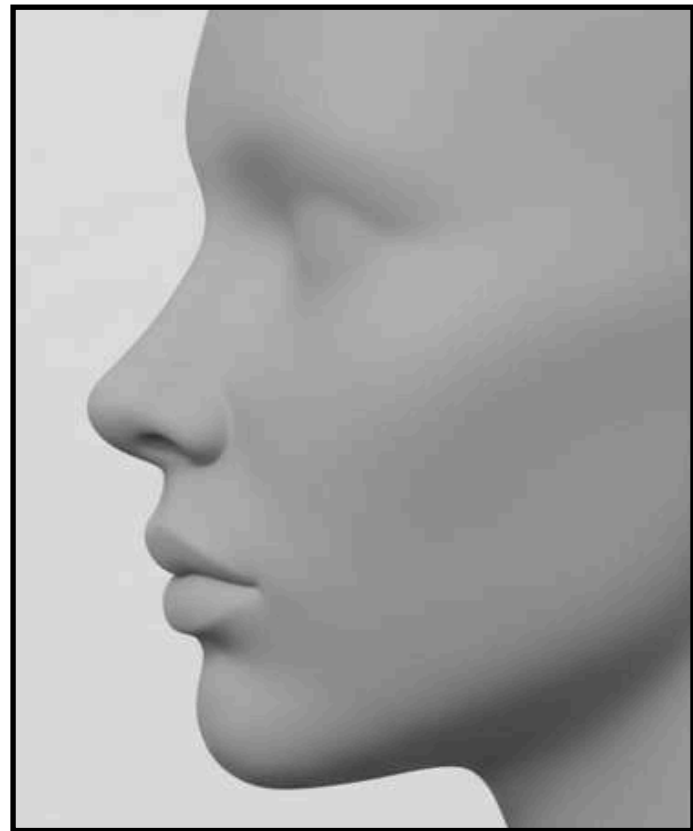

promoting better facial harmony, improved breathing, and a more lifted, resilient appearance.

Your goal is not to fight your natural shape, but to build the strongest, most defined version of it.

The Goal:

The "ideal" nose in contemporary aesthetics is often described as straight with a slight upturn and a defined tip. While a surgeon can sculpt this shape, a result that appears natural relies on the underlying structure and tissue health, not just form.

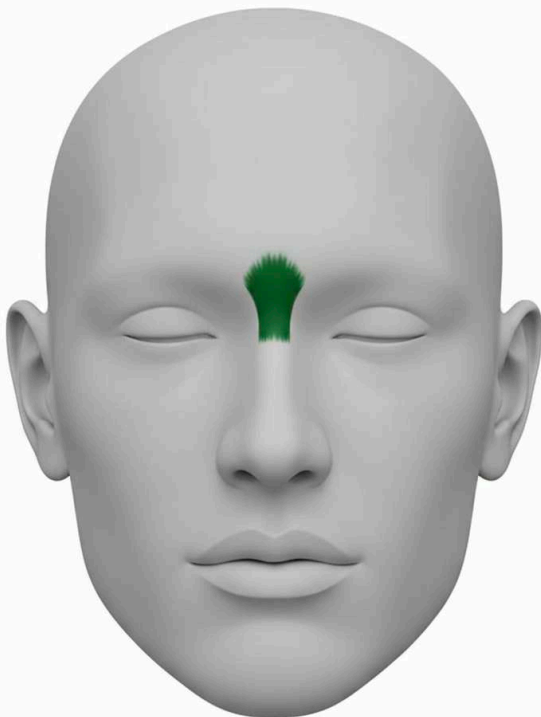

For most, achieving this exact shape naturally isn't possible—nor is it necessary. A better goal is to work with your natural anatomy to create the most balanced, refined, and healthy version of your own nose.

1. Support the Nasal Structure
2. Counteract Drooping & Refine the Tip
3. Define and Straighten the Bridge
4. Refine Nostril Shape and Strength

Important Disclaimer: These exercises are intended for minor refinement and muscular tone. They cannot change the fundamental shape of your nasal bone or cartilage. Significant changes are only possible through surgery. Consistency over months is required for subtle results. Stop immediately if you feel pain or discomfort.

Muscular Exercises

Procerus

Procerus Inhibitor

Pinch at the highest point of your nose with two fingers, place a third on your brow and push up (it will wrinkle your forehead), use this

muscle to push it down. Switch with your hand.

X25 times each side with each hand, if you can do it four sets of it, great

OPERATOR NOTES: THIS IS GREAT, IT HELPS WITH BREATHING AND GIVES A MORE FRIENDLY LOOK. IT WILL HELP SET THE EYEBROWS DOWN AND HELP WITH BREATHING ISSUES AS WELL. YOU CAN (AND SHOULD!) PLACE YOUR OPPOSITE PALM ON YOUR FOREHEAD TO AVOID WRINKLES.

What This Does:

Resisted Frown

Place your index and middle fingers horizontally across the bridge of your nose, just between your eyebrows.

Gently try to frown, pulling your eyebrows down and together against the resistance of your fingers. You can hold the contraction for up to 5 seconds.

Completely release and relax.

Work up to x50 times

Isometric "Nose Wrinkle"

Imagine you smell something unpleasant. Wrinkle your nose and try to pull your eyebrows down without moving the rest of your face. You can hold this subtle contraction for 3-5 seconds.

Work up to x50 times

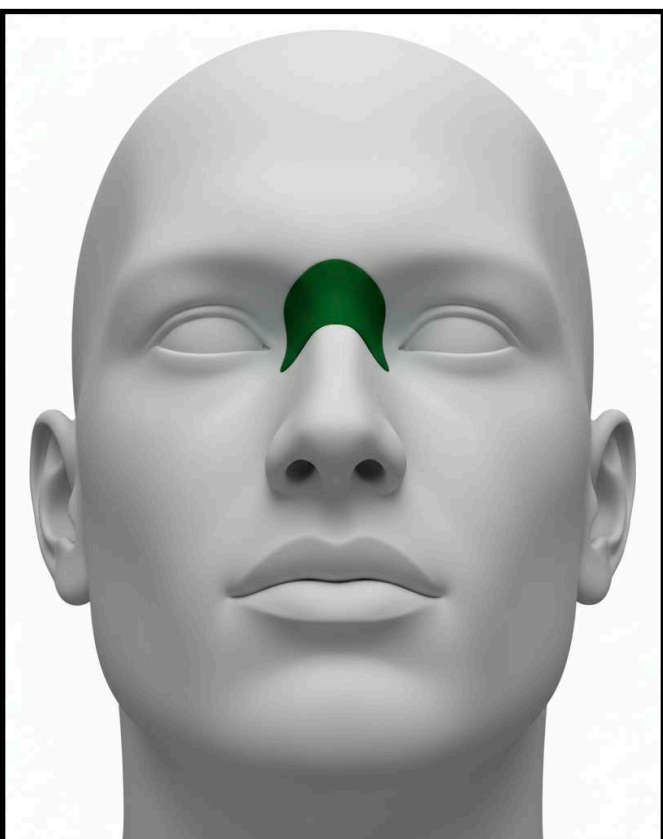

Procerus Control (Glabella Press)

Press fingers between brows while trying to frown downward.

Hold resistance for 5 sec, 8 reps.

Natalis

The key is to practice in front of a mirror. It involves very subtle movements.

The Nose Scrunch (Engaging the Transverse Part)

This is the easiest way to feel the muscle.

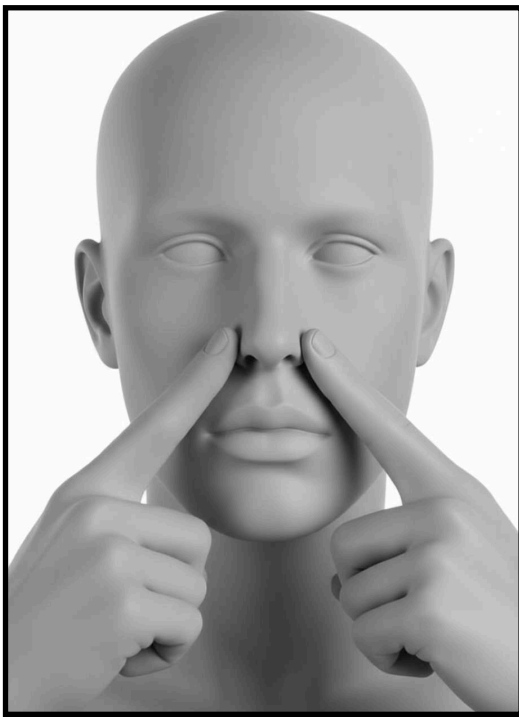

Look in a mirror.

Without moving your upper lip or cheeks, try to scrunch your nose upwards towards your eyes.

You should feel a tightening sensation across the bridge and sides of your nose. You may also see the skin on the sides of your nose wrinkle ("bunny lines").

Work up to x100 times

OPERATOR NOTES: PLACE A FINGER LIGHTLY ON THE SIDE OF YOUR NOSE TO FEEL THE MUSCLE CONTRACT AND ENSURE YOUR CHEEKS AREN'T DOING ALL THE WORK.

The Nostril Flare

(Engaging the Alar Part)

This isolates the part that opens your nostrils. Place fingers on the sides of the nose, you can pinch alternatively. Then

push apart with the nose. Flare your nostrils outward, as if you're smelling a strong scent or trying to get more air. You should see your nostrils widen. You will feel the sides of your nose and the base of your nostrils engage.

Work up to x100 times

Depressor Septi Nasi

Action:

Pulls the nasal tip
downward when you

animate your upper lip (e.g., talking, smiling, sneering).

Isolated Depressor Septi Resistance

Place two fingers on the upper lip and push up, then use your Depressor Septi Nasi to push down. Make sure your lips aren't dry. Focus on activating the muscle at the base of your nose and the center of your upper lip. Without moving your head, attempt to pull your lip and nasal tip straight down against the resistance of your fingers. You should feel a distinct, deep tension at the nasal spine (the base of your nose).

Work up to x100 times

Nasal Tip Elevation Resistance

Pinch the bridge of your nose gently with your non-dominant hand (thumb and index finger). With the index finger of your other hand, apply gentle upward pressure

to the very tip of your nose, lifting it slightly. From this lifted position, attempt to push the nasal tip back down against the resisting finger. The pinch on the bridge helps isolate the movement to the lower nasal cartilage. The primary tension should be felt deep at the columella and nasal base.

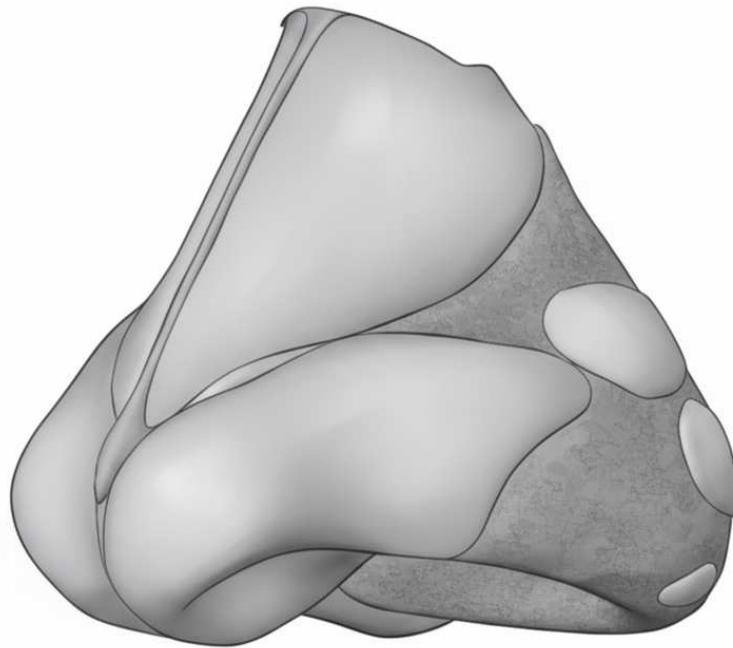

Start at x20, then work your way up to x50 times and eventually x100.

What This Does:

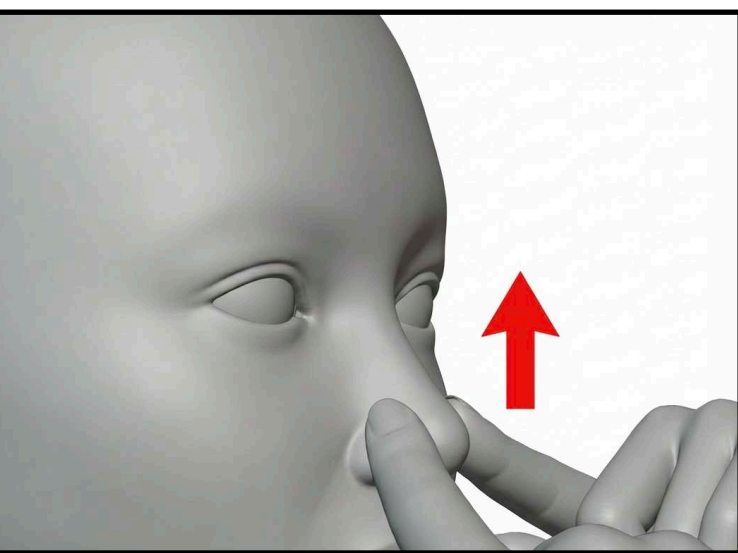

Massages

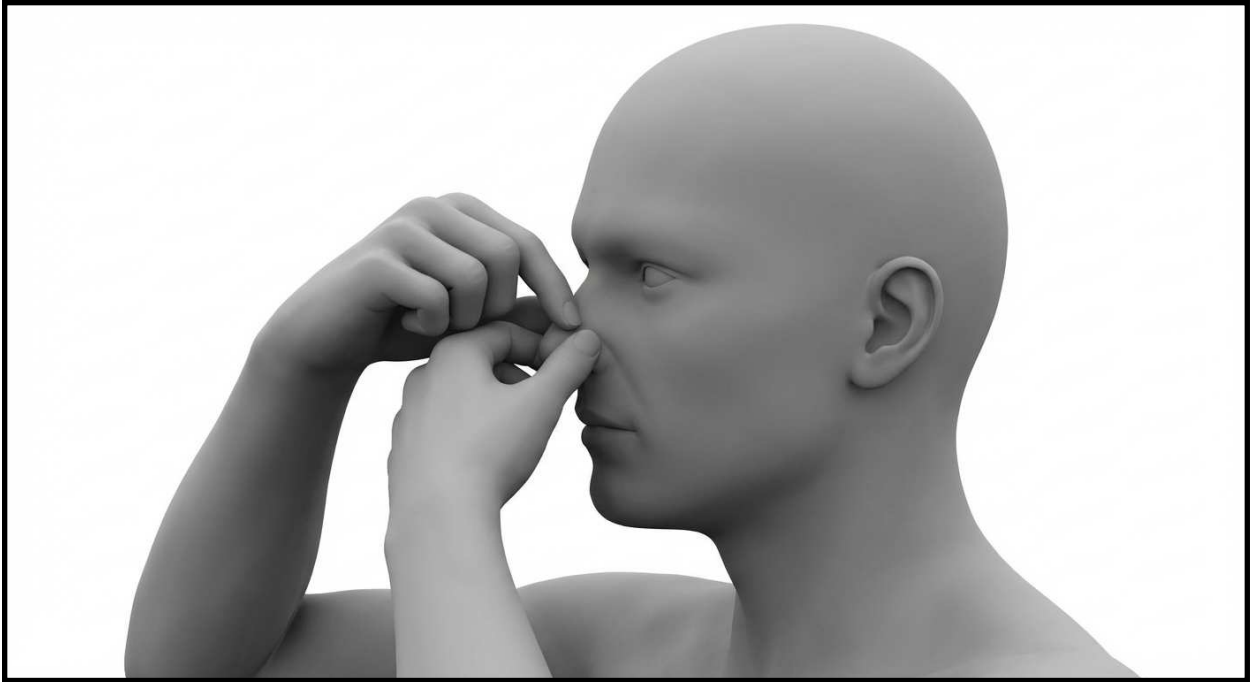

7.1 Nose Massages

Now our goal is to modify our nose tissue, particularly the pronasalae. We only want to focus on our nose tissue, **NOT** our nose ridge.

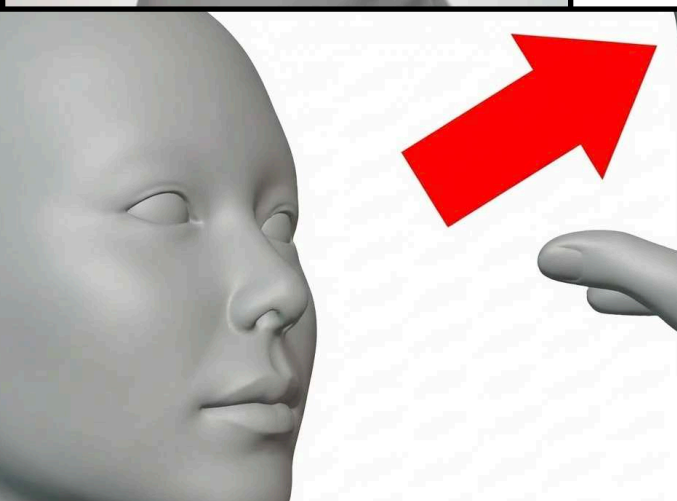

Pinch the nose, up and out.
Repeat to x100 times

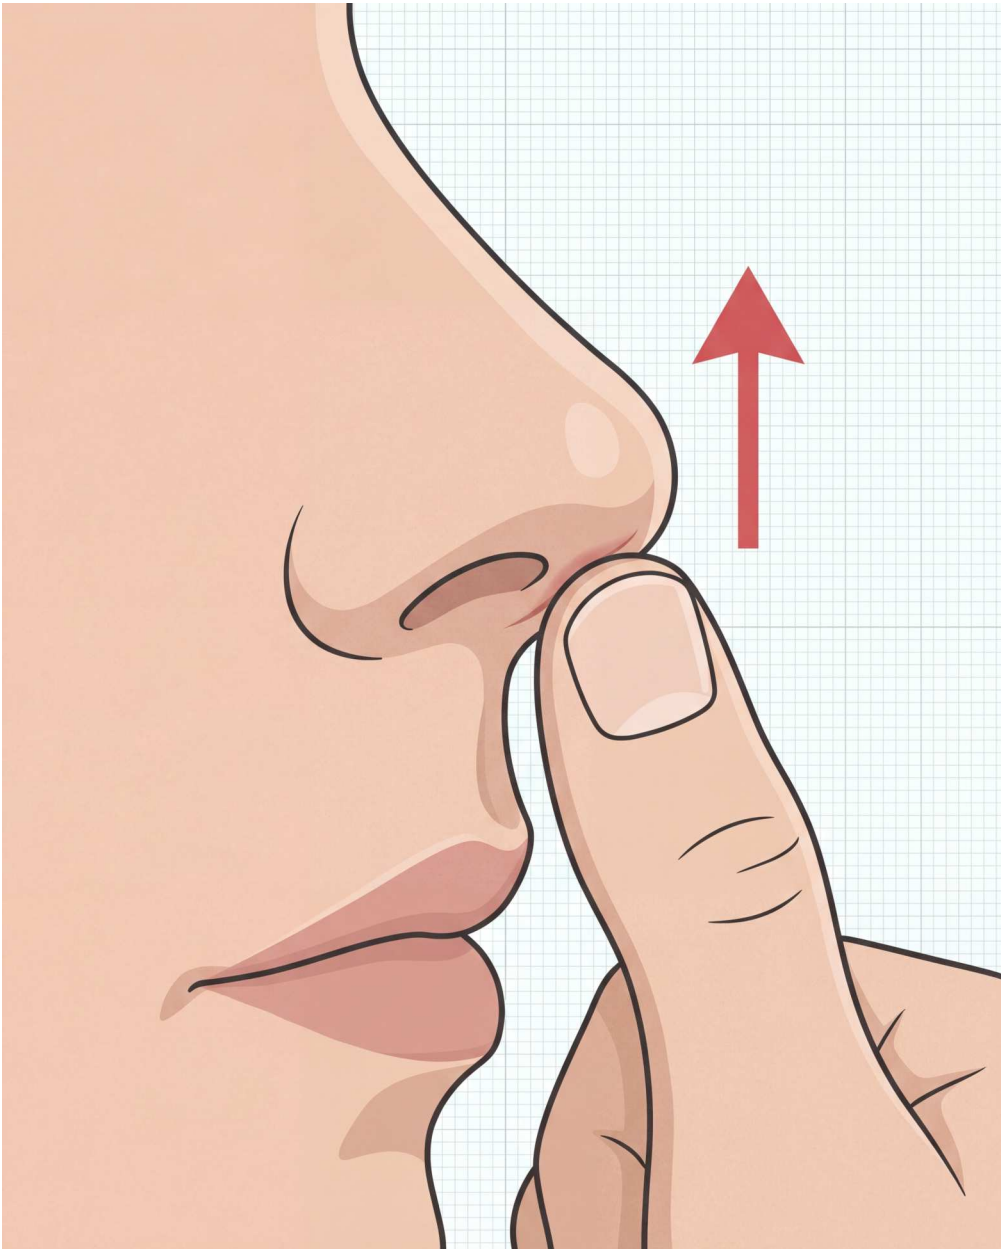

Pull the tip of the nose up and out, as if pushing it forward. Repeat to x100 times

If you have an african or asian nose, you'll want to pinch tightly for about thirty seconds. Work your way up to a few minutes.

If you have an African or Asian nose, you'll to use the palms to squeeze and pull the nose out.

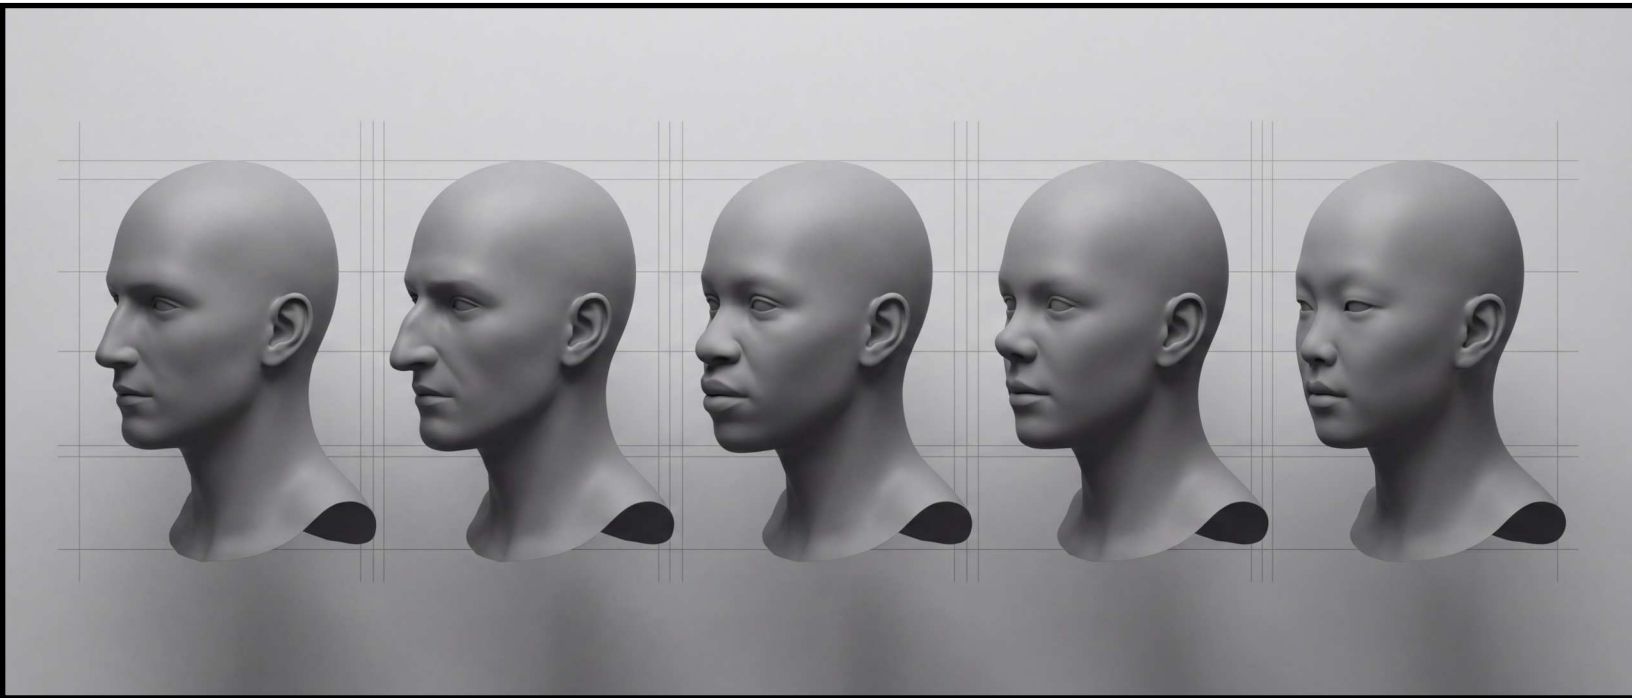

IMPORTANT

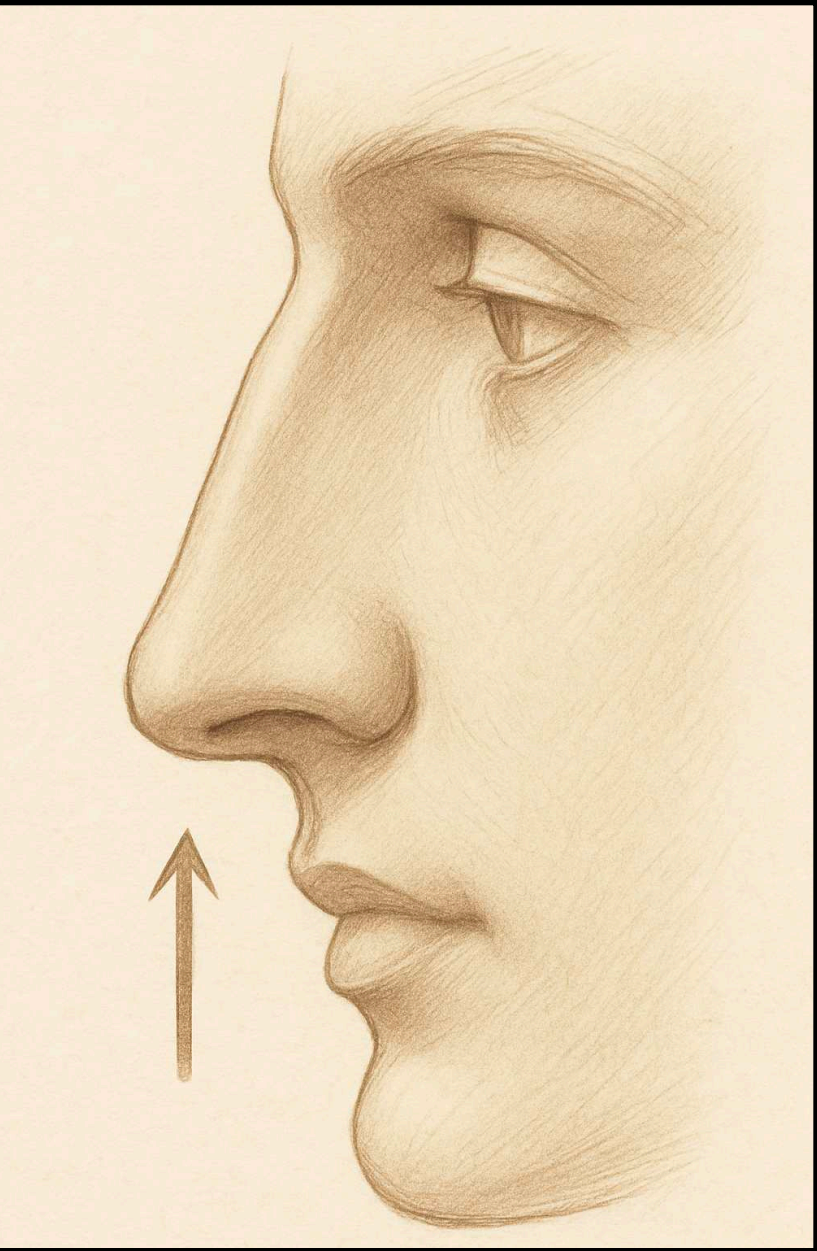

Use **BOTH** thumbs, rub continuously, with **SOFT** but **constant pressure**. Do it x100 times. This is what pushes our nose tissue up, the longer, the better, do not go too

hard, it will squish the nose. Then make sure to massage outward and along the nose to smooth it out.

Refinement

7.2 - The Historical Five Nose Types

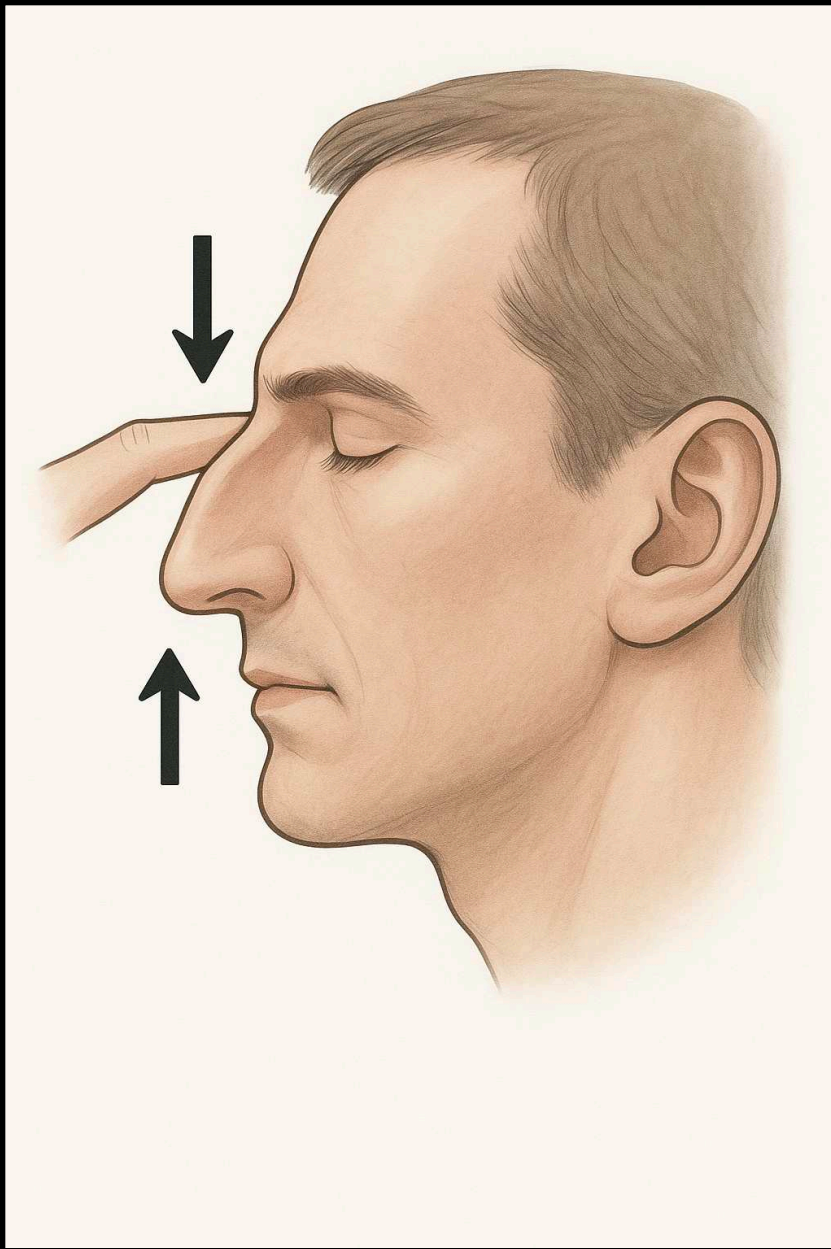

The Greek or Straight Nose (Classic):

Description: Characterized by a perfectly straight bridge from the brow line to the tip, with very narrow nostrils. It was considered the aesthetic ideal, named after the profiles seen in classical Greek sculpture.

Associated Stereotype:

Refinement, beauty, and intellectual calm.

How to work it: Congratulations, this is the easiest nose to work with. The goal here is to uptick the nose or turn it up and to thin it out as well.

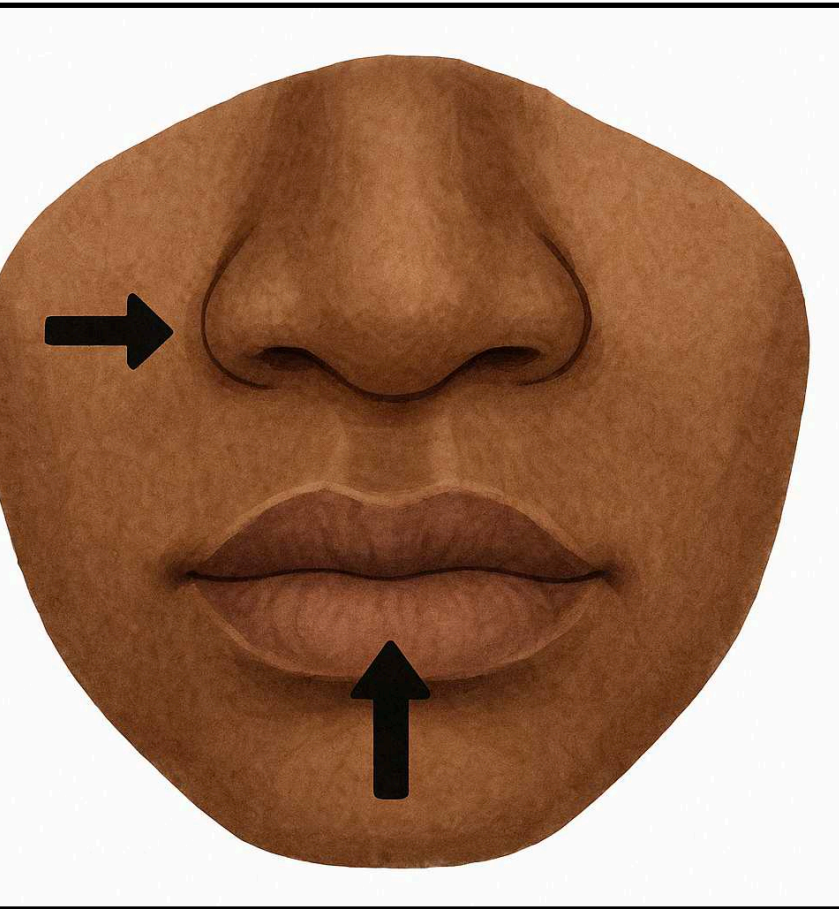

The Roman or Aquiline Nose (Hook-Shaped):

Description: Defined by a prominent, high bridge that curves slightly downward, giving it a hooked or eagle-like appearance (aquiline comes from the Latin for "eagle").

Associated Stereotype: Authority, strength, ambition, and leadership. It was often linked to figures of power in history.

How to work it: Reduce the beak by pushing down on it (from above, be careful as not to push the cartilage down. Massage the sides and uptick the nose.

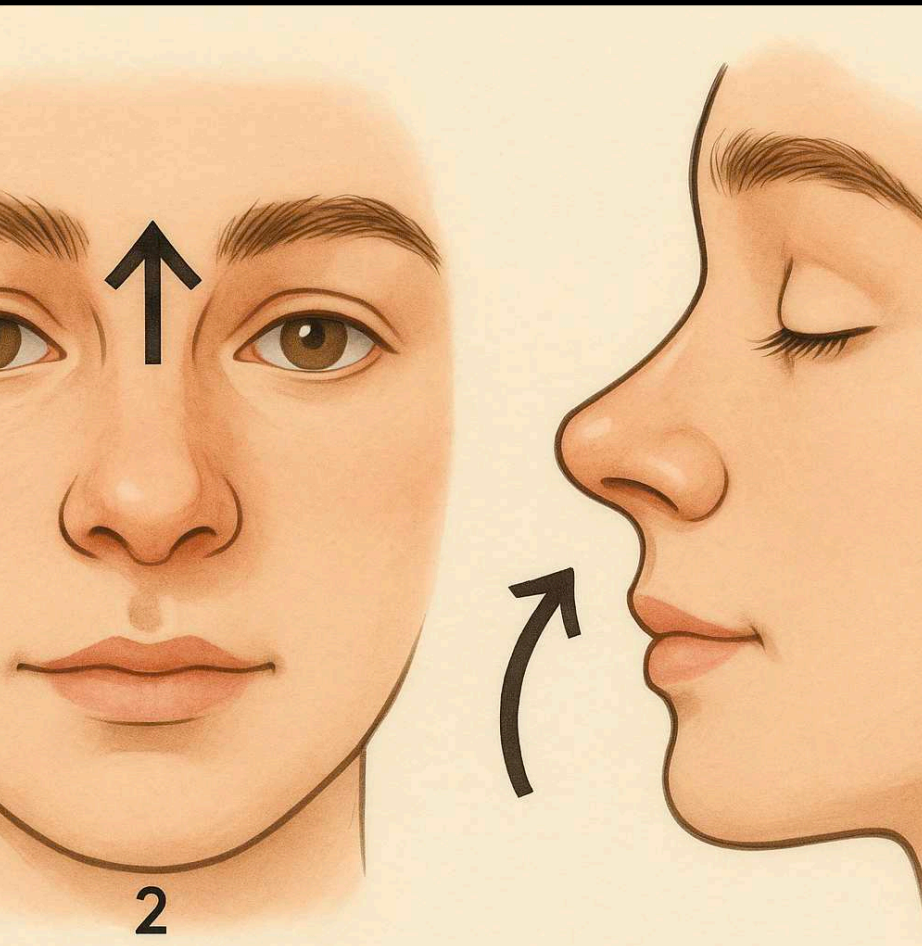

The Nubian or African Nose (Wide and Flat):

Description:

Characterized by a wider base, broader nostrils, and a flatter bridge. This

shape is commonly found in individuals of African descent.

How to work it: We want to pull the nose up - and out. We also want to thin it out and as well pull it down, closer to our lips. We really want to focus on the nostrils here and to thin those out.

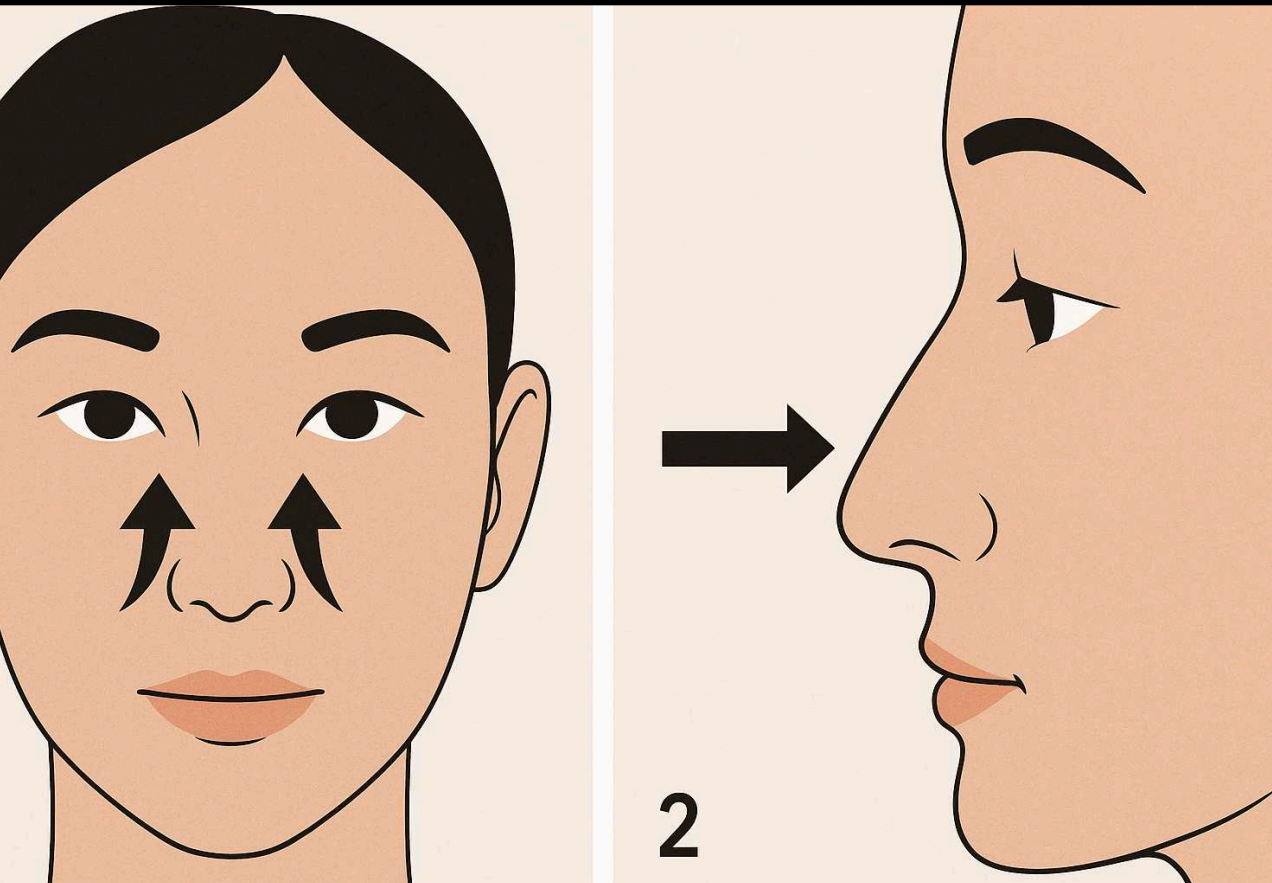

The Snub or Celestial Nose (Small and Upturned):

Description: A small nose with a concave profile and a tip that

points slightly upward, revealing the nostrils.

How to work it: We want to keep the uptick, and focus particularly hard on strengthening the top of the ridge of the nose and lengthening the nose as much as possible.

The Asiatic or Small Nose (Delicate and Low Bridge):

Description: Described as having a low, flatter bridge, a rounded tip, and narrower nostrils. This was a broad and inaccurate categorization for noses commonly found in East Asian populations.

How to work it: We want to combine the practices of the Nubian nose, pull it up and forward but also the Greek nose, upticking the nose or pushing it up.

Nose Bone Modification

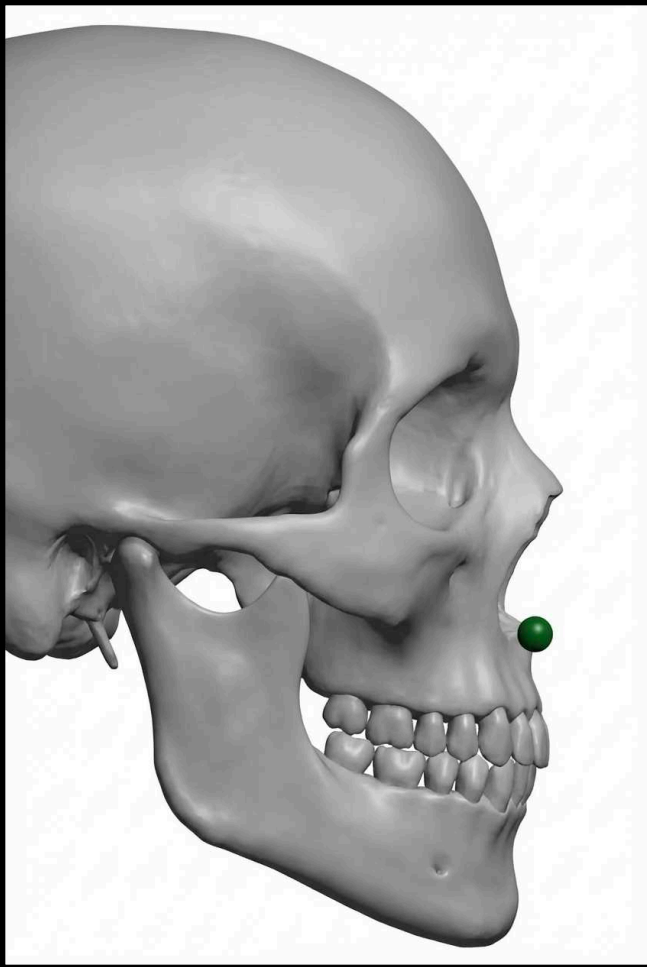

DISCLAIMER! - You can mess up your face, if it hurts - STOP DOING IT! Take your time and work your way up and apply light pressure, over time.

NYX DIRECTIVE

The Anterior Nasal Spine (ANS) Modification

What it is: The Anterior Nasal Spine is a small, sharp, forward-projecting prominence of bone. It is part of the maxilla (the upper jawbone), but it is a distinct and specific landmark.

Location: It is located at the very bottom of the pear-shaped piriform aperture (the bony nasal opening), right where the two halves of the maxilla fuse together in the center. It sits just above the teeth, behind the upper lip.

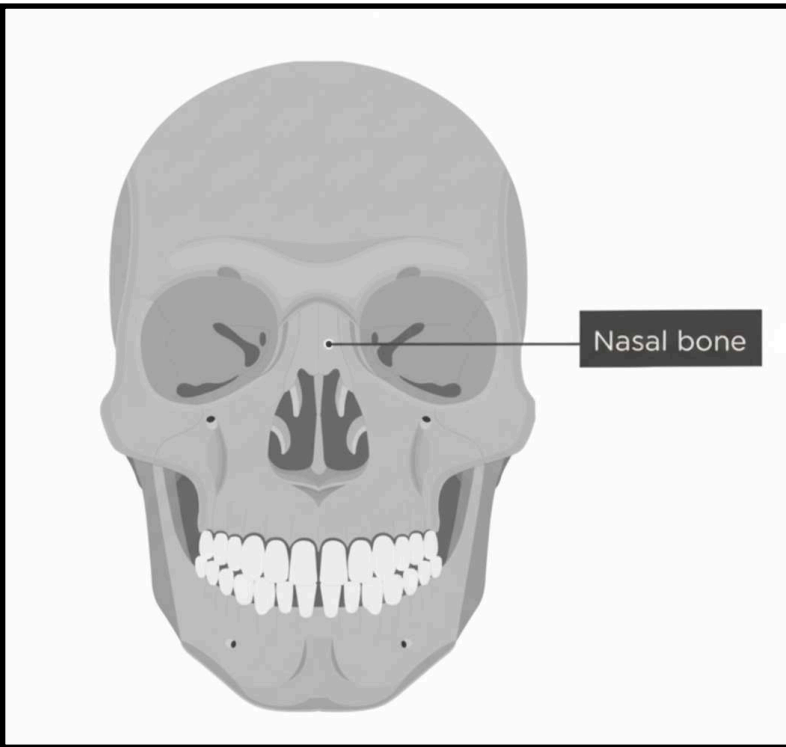

What you feel: When you run your finger up the groove of your philtrum (the vertical groove between your nose and mouth) and feel a small, firm, V-shaped notch at the very top, you are feeling the Anterior Nasal Spine. It is the central anchor point for the base of the nasal septum and the nasolabial muscles.

Modification:

Place your fingers underneath this bone and an thumb finger to guide it. Push up for thirty seconds, this will help lift up the entire nose. *Work*

your way up to a few minutes. Take your time, go slow, if it feels off, stop!

The Nasal Bones

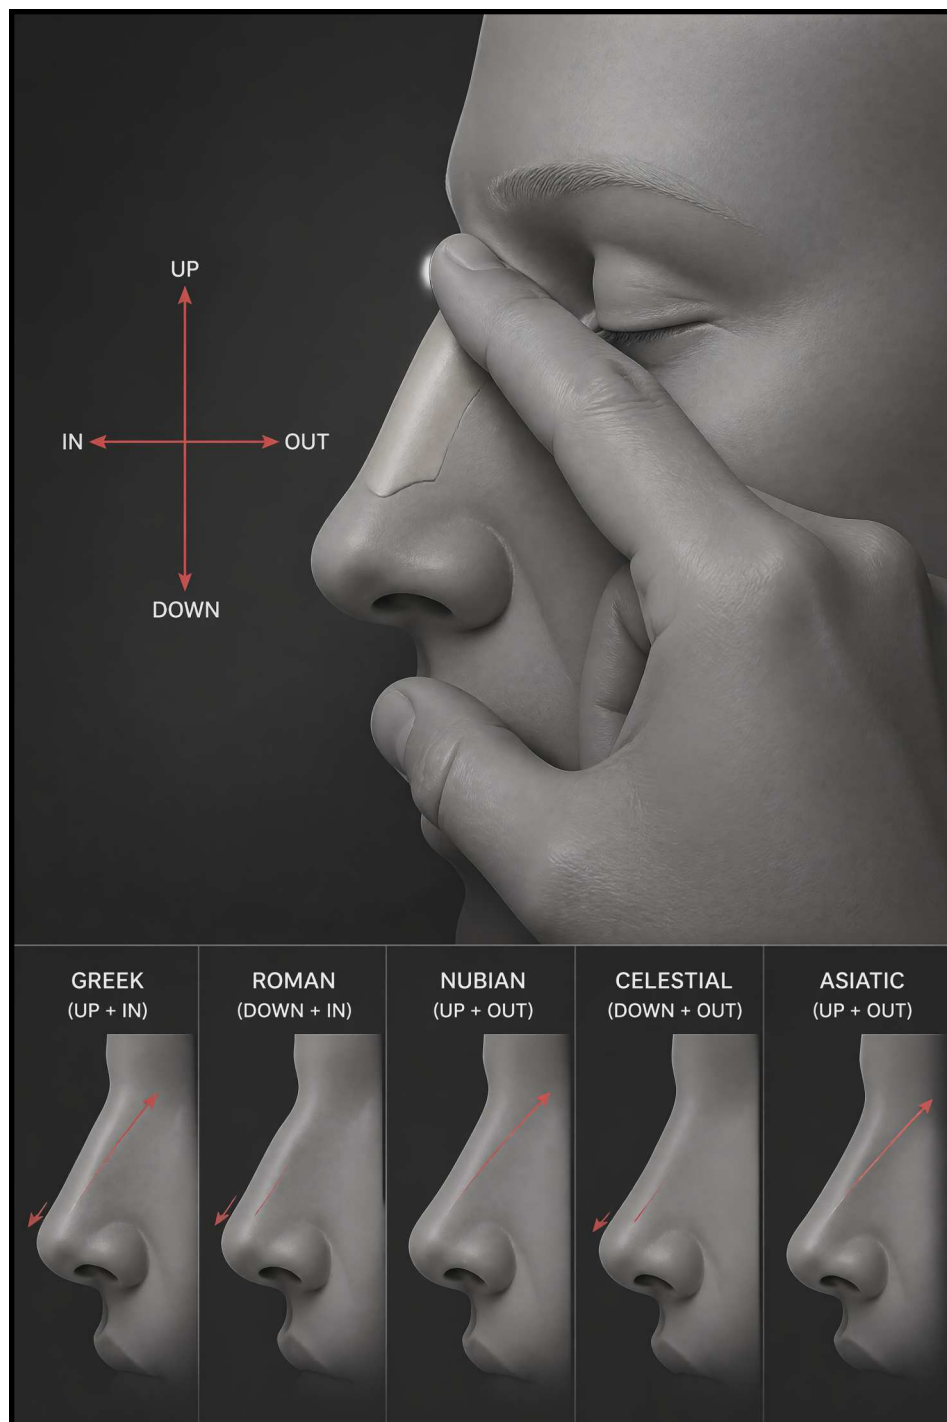

The Nasal Bones

What they are: The Nasal Bones are two small, rectangular bones that sit side-by-side in the upper third of the nose. They are among the smallest and

most fragile bones in the face.

Location: They form the bridge of the nose, spanning from just below the glabella (the smooth area between the eyebrows on the frontal bone) down to the middle third of the nose. They are the reason the upper part of your nose is hard and immobile.

What you feel: When you pinch the upper part of your nose, between your eyes, the hard structure you feel is the fused pair of nasal bones. The lower part of your nose, which is soft and flexible, is where the nasal bones end and the nasal cartilages begin.

Modification:

Greek Nose: Push the nasal bones - **UP! And IN!**

Roman Nose: Push the nasal bones - **DOWN! And IN!**

Nubian Nose: Push the nasal bones - **UP! And OUT!**

Celestial Nose: Push the nasal bones - **DOWN! And OUT!**

Asiastic Nose: Push the nasal bones - **UP! And OUT!**

You can EITHER:

Rub two fingers along the nose (with lots of oil) and press in.

OR:

Use your entire hand (remember to switch hands). Think of the perfect nose from earlier and think of how you would have to “modify” your nose. Then use consistent **but a small amount** of force. Start at a MAXIMUM of twenty seconds and take a break. Work your way up to a few minutes.

Afterwards, relax and rub the nose with your fingers to help also “shape it”, use moderate force and go slow, there is no repetition, just do it till it feels comfortable.

VOSTOK

ANATOMICAL DIAGRAM

LATERAL NASAL
BRIDGE ADJUSTMENT

TECHNIQUE:

Apply gentle lateral pressure
to the nasal bridge to guide
structural realignment.

DIRECTIONAL ADJUSTMENT

LEFT

DIRECTIONAL ADJUSTMENT

RIGHT

V
VOSTOK
METHOD

Modification:

I was fortunate to start with a naturally balanced nose—almost ideal—but after breaking it multiple times, minor asymmetries developed. If you've had similar trauma, structural correction may be necessary first. For day-to-day adjustment, the key is sensitivity. Close your eyes and rely on touch. Apply steady lateral pressure from one side of the bridge for about thirty seconds, focusing on subtle internal movement rather than force. Repeat on the opposite side. You can also press gently into the upper bridge near the brow, guiding the structure inward and outward. Done correctly, the effect is immediate—clearer onflow and a more aligned feel.

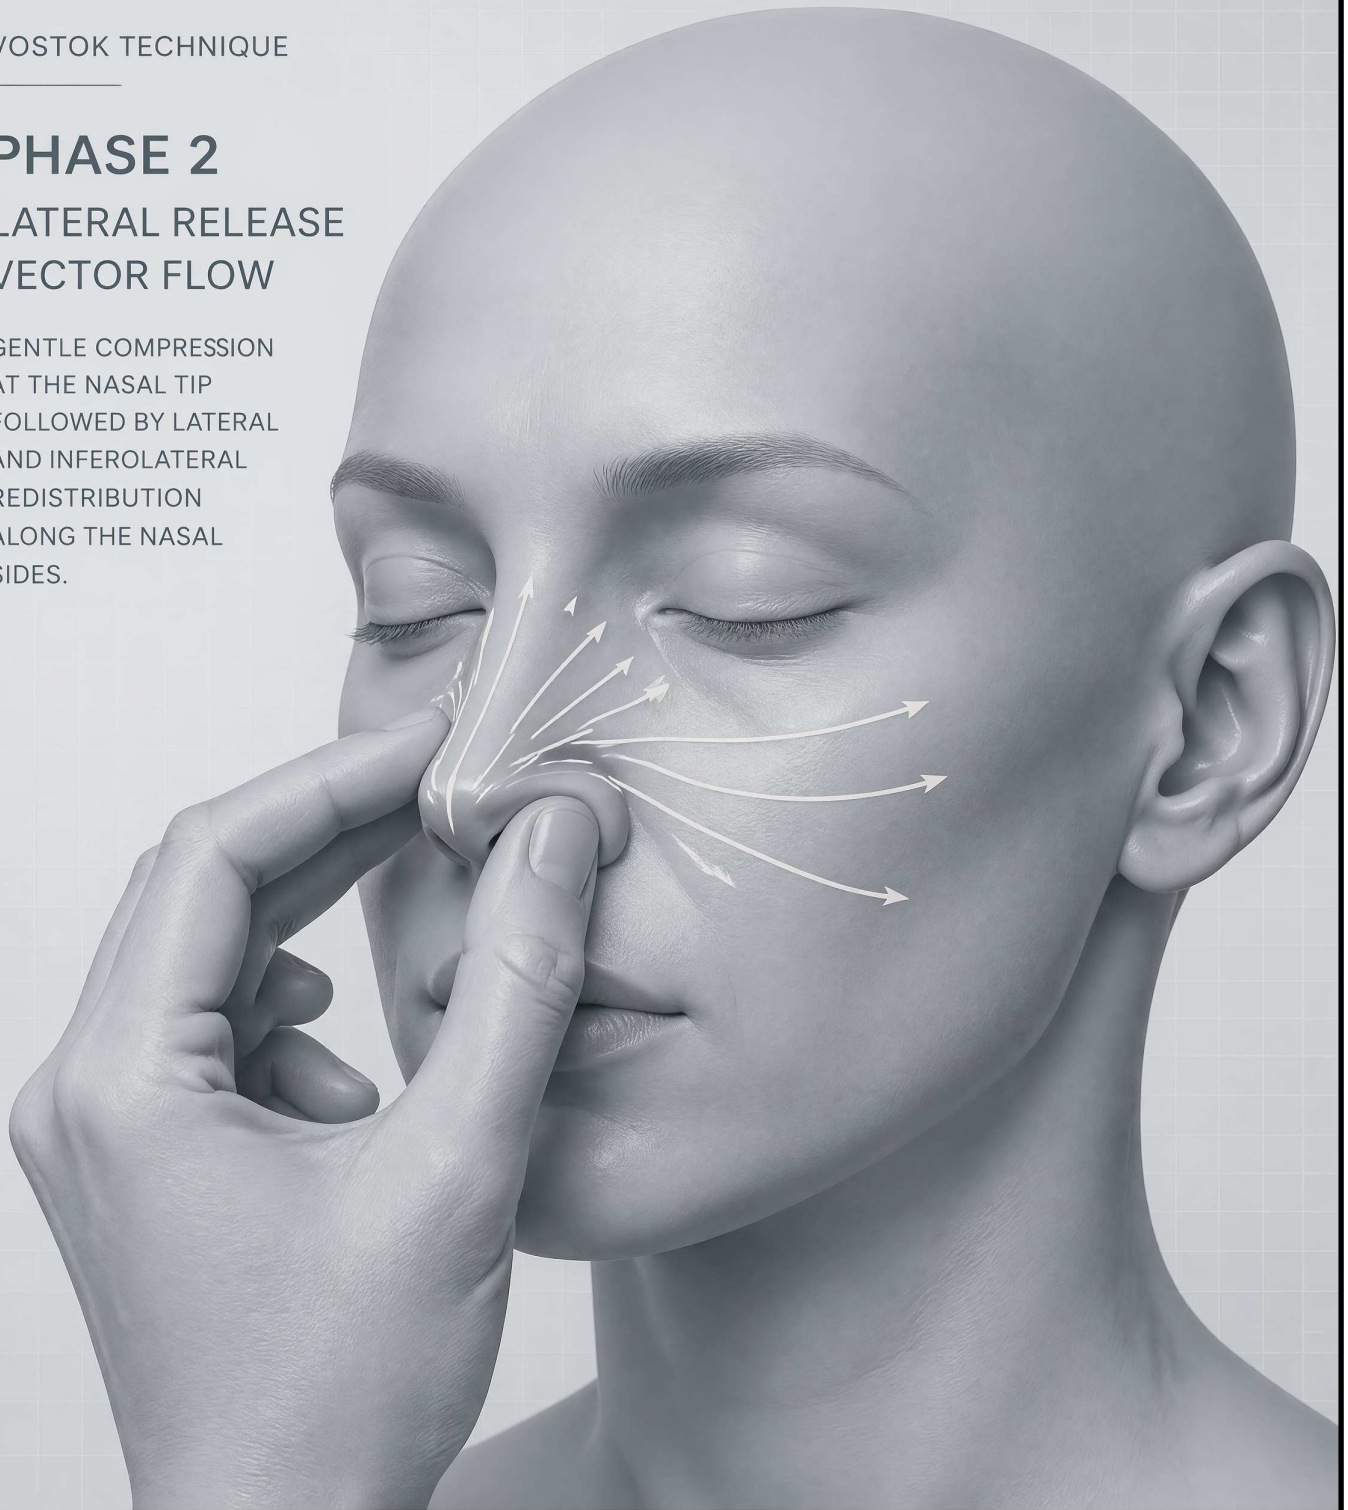

Modification:

Cartilage in the nose and ears naturally loses firmness over time as collagen and elastin degrade, which can lead to gradual drooping. A simple maintenance method uses controlled compression to support tissue integrity. Form a relaxed cup with your hand and apply even, light pressure

PHASE 2

LATERAL RELEASE VECTOR FLOW

- REDISTRIBUTE TENSION Laterally and INFEROLATERALLY
- RESPECT ANATOMICAL PLANES AND VASCULAR PATHWAYS

around the nasal tip and lower third—never forceful, just contained. Then perform 50–100 gentle outward strokes along the sides of the nose, moving from the bridge toward the cheeks. This helps guide fluid movement, improves skin adherence to underlying structure, and reduces the visual effect of sagging over time.

The Dragon of the Face

Forget biceps. The tongue is the body's most powerful muscle, but we treat it like a passive accessory.

That's a huge mistake. Your tongue is your secret weapon for presence. It's not just for eating or talking. It's the architect of your facial structure. A strong tongue actively lifts your palette and pulls your entire mouth forward, creating that natural, open, 3D projection that looks confident and alive.

The impact is immediate. A strong tongue:

- Makes you look more expressive.
- Makes you look more confident.
- Makes you look younger.

Chapter 8: The Tongue

8.0 - The Tongue

The tongue is arguably one of the most crucial yet most overlooked muscles in the body when it comes to overall health, from basic survival functions like swallowing to complex facial aesthetics. There are four primary muscles to work.

Muscle	Origin	Function	Key Role
Genioglossus	Mandible (chin bone)	Protrudes the tongue (sticks it out). Depresses the center.	The "safety muscle." Prevents airway obstruction during sleep. CN XII

Hyoglossus	Hyoid bone	Depresses and retracts the tongue.	Flattens and pulls the tongue back down. CN XII
Styloglossus	Styloid process (temporal bone)	Retracts and elevates the tongue.	Pulls the tongue back and up, as in swallowing. CN XII
Palatoglossus	Styloid process (temporal bone)	Elevates the back of the tongue. Depresses the soft palate.	Closes off the oral cavity from the pharynx during swallowing. Vagus Nerve (CN X)

The Tongue as a Guardian Against Choking

Choking isn't just about a piece of food "going down the wrong pipe." It's often a failure of the complex, muscular

swallowing sequence, in which the tongue is the star player.

The Swallowing Process (The Tongue's Masterpiece):

Bolus Formation: The tongue's intrinsic muscles expertly manipulate and shape food into a soft, rounded ball called a bolus.

The "Power Stroke": This is the critical phase. The tongue presses upward and backward against the hard palate (roof of the mouth) in a wave-like motion, propelling the bolus into the pharynx (the throat).

Airway Protection: As the bolus is pushed back, the tongue base and other muscles help trigger the reflexive closure of the epiglottis—a flap that seals the windpipe (trachea) to prevent food from entering.

The "Natural Orthodontic" Mechanism:

The proper resting position for the tongue is with the entire tongue suctioned against the roof of the mouth (the palate), tip just behind the front teeth. This posture applies constant, gentle, upward and forward pressure.

Palatal Expansion: In children and adolescents, whose sutures (the seams between skull bones) are not fully fused, this upward pressure encourages the maxilla (upper jaw) to grow wider and forward. A wide palate is the foundation for:

- Straight teeth without crowding.
- A well-defined, prominent cheekbone structure.
- Adequate nasal airway space.

Forward Guidance: The forward component of this pressure, primarily from the genioglossus muscle, helps guide the entire maxilla and mandible (lower jaw) to develop forward, creating strong, defined facial profiles and preventing a "weak chin" or recessed jaw.

What Happens with a Weak/Improperly Positioned Tongue (Low Tongue Posture):

- **Mouth Breathing:** The tongue falls to the floor of the mouth, breaking the oral seal and encouraging mouth breathing.
- **Narrow Palate & Crowded Teeth:** Without the tongue's opposing force, the cheeks exert inward pressure, leading to a narrow, V-shaped dental arch.
- **Recessed Jaw & Poor Profile:** The lack of forward guidance allows the jaw to grow downward and backward, leading to a less prominent chin, a "gummy" smile, and a less defined jawline.
- **Compromised Airway:** A recessed jaw and narrow palate reduce the space in the nasal pharynx,

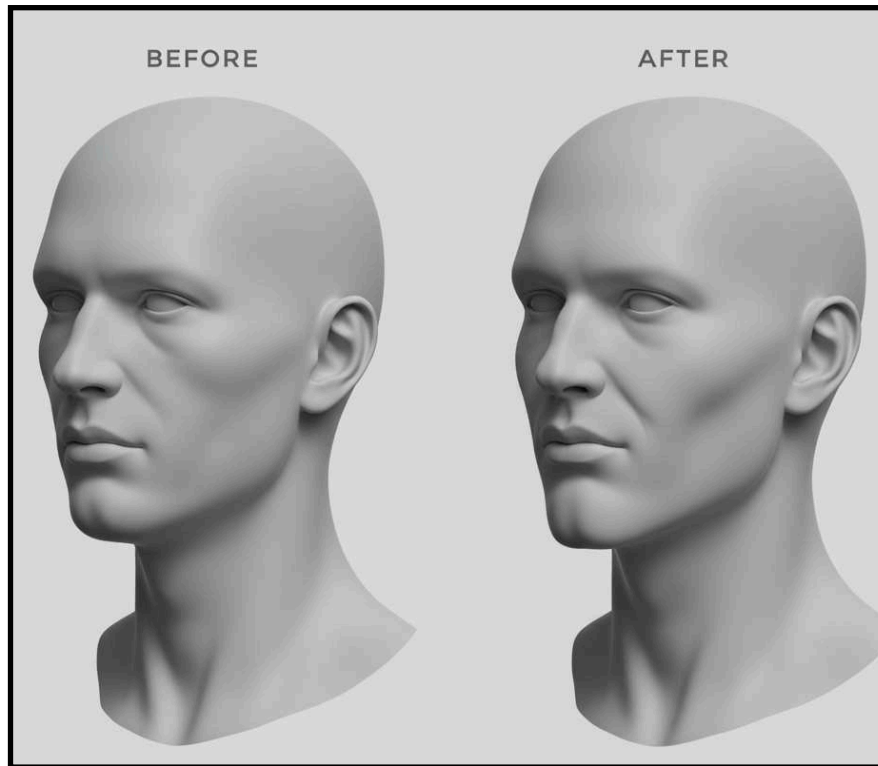

contributing to sleep-disordered breathing like sleep apnea.

What a Strong Tongue Does:

Tongue Workout Benefit:

By training the tongue

to maintain correct oral posture and strengthening the muscles that pull it forward (genioglossus), you encourage better craniofacial development in youth and can help maintain the forward position of the jaw and hyoid bone in adulthood, which is critical for keeping the airway open.

Superior Longitudinal Muscle

Tongue Protrusion (The Primary Exercise)

Stick your tongue out as far as you can, aiming for something in front of you. Focus on pushing the back of your tongue forward. You can hold this fully protruded position for 5-10 seconds. Relax and pull your tongue back in.

Beginner: 20

Intermediate: 40

Expert: 60

Master: 100

OPERATOR NOTES: THIS EXERCISE IS SUPER TIRING, SUPER QUICK. YOU CAN TAKE A BREAK IN BETWEEN YOUR REPS. YOU CAN ALSO RAPIDLY PULSE THE TONGUE IN AND OUT TO HURRY THE WORKOUT. THIS EXERCISES JUST CRUSHES NASOLABIAL LINES.

Tongue Tip Curl

Action: Open your mouth slightly. Curl the tip of your tongue upward toward your nose, as if trying to touch the roof of your mouth just behind your teeth. The middle and back of the tongue should remain down. Hold the curled position.

Focus: You should feel a strong contraction along the top surface of your tongue. Use a mirror to ensure the tip curls up independently, without the whole tongue rising.

Reps:

Beginner: 15 seconds

Intermediate: 30 seconds

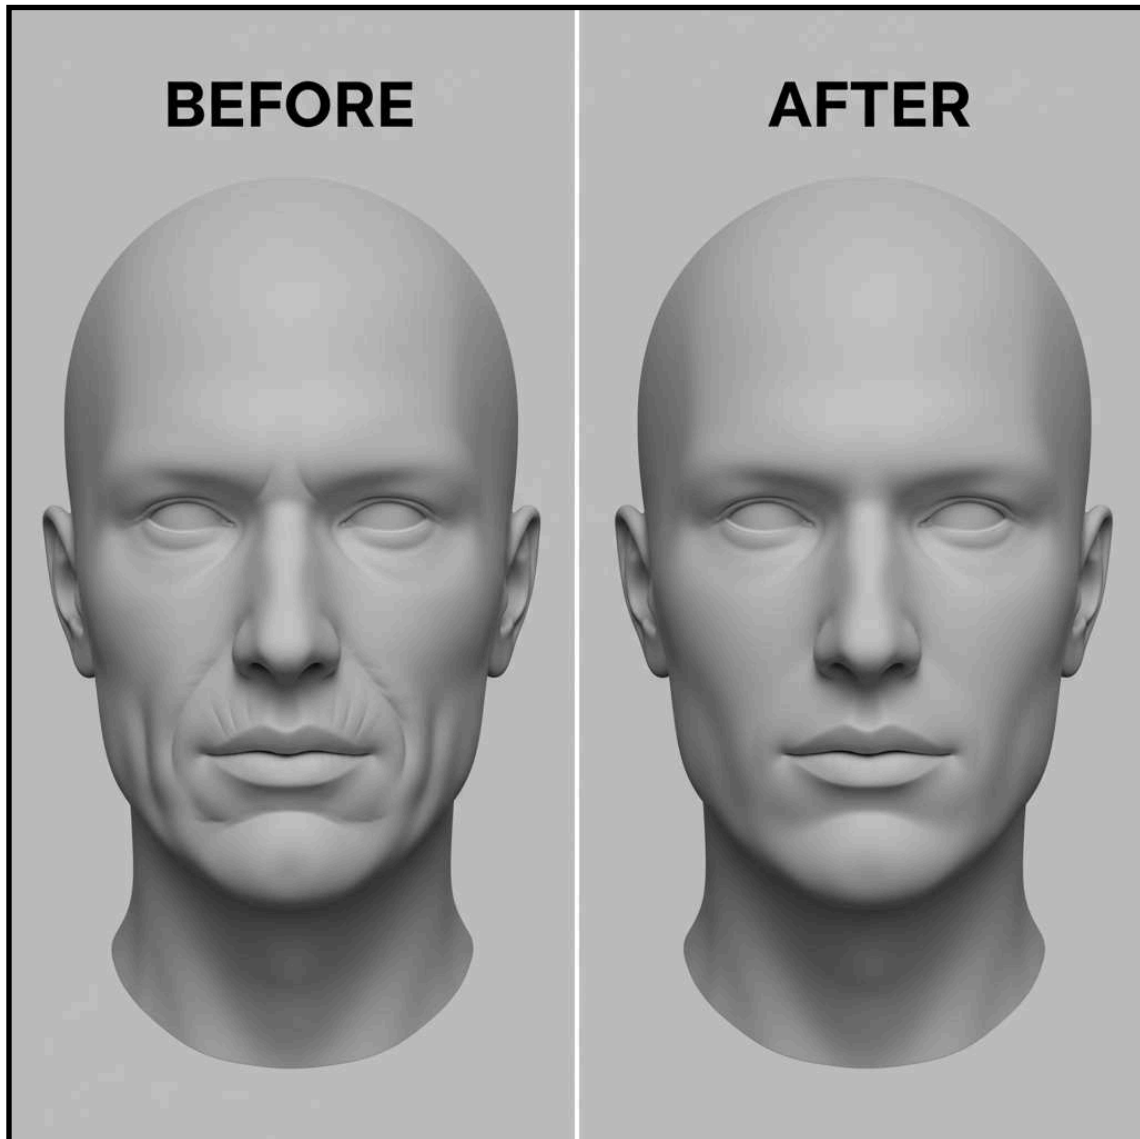

Expert: 50 seconds

Master: 75 seconds

OPERATOR NOTES: THIS ISOLATES THE SUPERIOR LONGITUDINAL MUSCLE SPECIFICALLY. IF YOUR WHOLE TONGUE LIFTS, YOU'RE CHEATING. KEEP THE

BACK DOWN, TIP ONLY. PAUSE BRIEFLY AT THE TOP OF EACH CURL. GREAT FOR REFINING TONGUE CONTROL AND IMPROVING HARD PALATE CONTACT DURING RESTING POSTURE.

What This Does:

Tongue Spoon Press

Grab a large table spoon, place the reverse on the top of your tongue, press up.

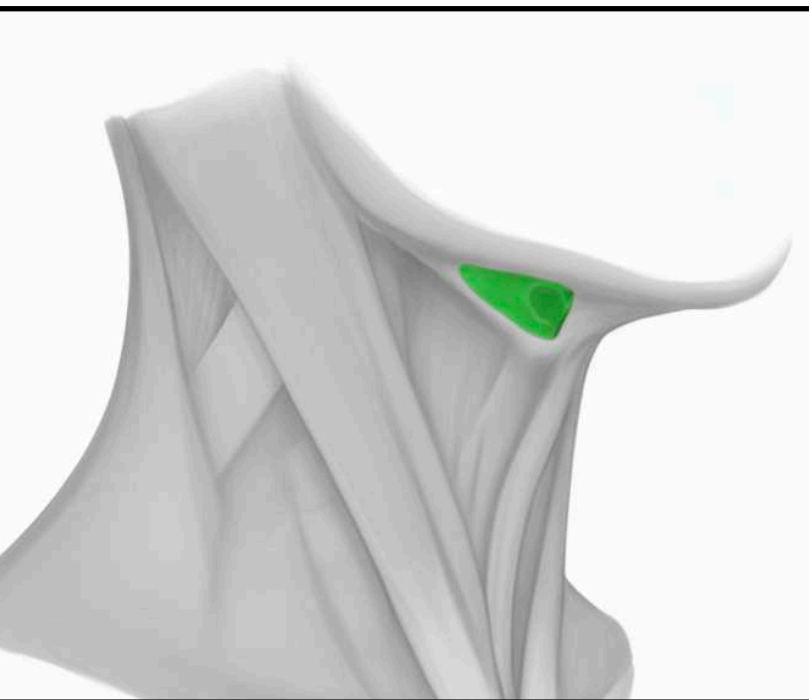

Beginner: 10

Intermediate: 20, take a break

Expert: 70

Master: 100

The tongue muscle is usually well developed because we eat soft foods, but training this will make the tongue place itself on the top of your mouth. This is necessary and is the proper position.

The Hyoglossus

Function: Depresses and retracts the tongue (pulls it down and back). It flattens

the tongue.

Tongue Depression (Primary Exercise)

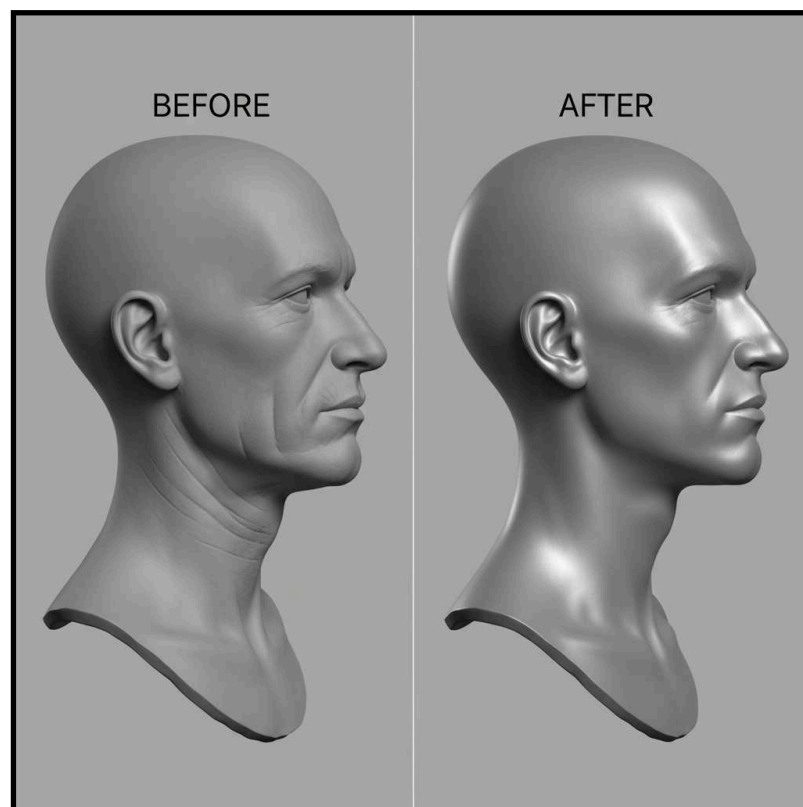

Start with your tongue in a neutral position. Forcefully press the entire body of your tongue downward against the floor of your mouth. Try to create a wide, flat, "pancake" tongue. You can hold this maximal depression for 5 seconds or alternatively just pop this repetition off quickly. Alternatively, you can just keep the pressure there the whole time and hold it for a minute to a few minutes.

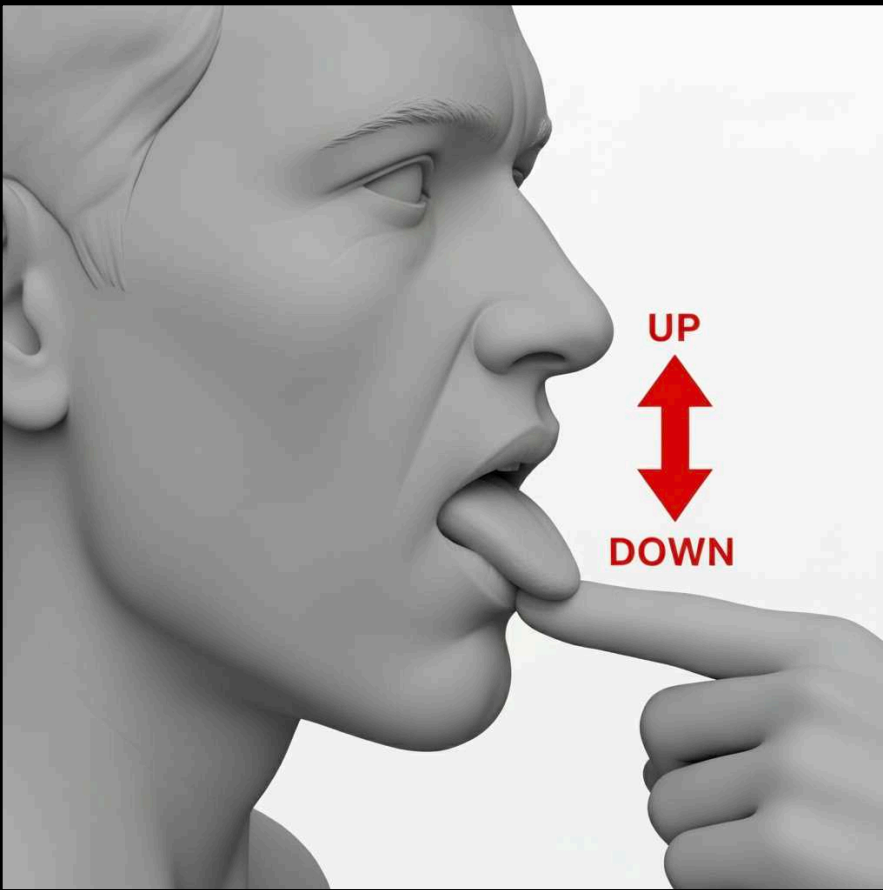

Expert: 60

Master: 100

OPERATOR NOTES: YOU WILL HAVE TO PRESS FORCEFULLY AGAINST YOUR BOTTOM TEETH TO MAKE THIS WORK. DON'T BE AFRAID TO USE SOME FORCE. IT'S OKAY FOR YOUR JAW TO DROP A BIT, THIS IS NATURAL. THIS EXERCISE WILL HELP GET RID OF AGING LINES IN THE NECK AND HELP GET RID OF "TURKEY NECK".

What This Does:

Resisted Tongue Retraction

Stick your tongue out.
Clean your hands (with
rubbing alcohol and
then soap - make sure

your nails are clean) and use the back of three fingers to
push the tongue up. Keeping constant tension, push the
tongue down against the resistance of the fingers, then
retract the tongue back up and slightly back into the
mouth. Keep the constant tension there. You can hold the
downward position for 3-5 seconds, then relax.

Do sets of 10, take a rest

Gradually work your way up to doing 5 sets for a total of
50

The "Tongue Groove"

This is an advanced intrinsic and hyoglossus co-contraction. Try to form a deep, central groove or trench along the length of your tongue while it's resting in your mouth. This action depresses the center of the tongue, engaging the hyoglossus. Hold for 5 seconds.

Beginner: 10

Intermediate: 20

OPERATOR NOTES: IGNORE THE SENSATION OF THE TONGUE, RATHER YOU'LL FEEL THE SIDES - THE LOWER SIDES OF YOUR MOUTH CLAMP UP, IT'LL FEEL TIGHT - THATS YOUR HYOGLOSSUS AND THAT'S WHAT WE WANT TO TIGHTEN UP AND WORKOUT.

Styloglossus Workout

Function: Retracts and elevates the tongue (pulls it up and back). It's crucial for the swallowing motion.

Tongue Retraction to Soft Palate

Open your mouth as if to say "Ahhh." Now, try to pull the back of your tongue upward and backward toward your soft palate (the back, soft part of the roof of your mouth). You should feel a squeezing sensation in the back third of your tongue and the walls of your pharynx. You can flick the tongue forward but the tongue for the most part should not really leave the mouth.

Sets of 15, take a break

Work up to five sets as you gain mastery

OPERATOR NOTES: THIS CAN CRACK THE LIPS, YOU CAN SPLASH SOME WATER ON THEM OR APPLY BALM. THIS IS A GREAT EXERCISE TO CREATE A MORE POINTED FACE.

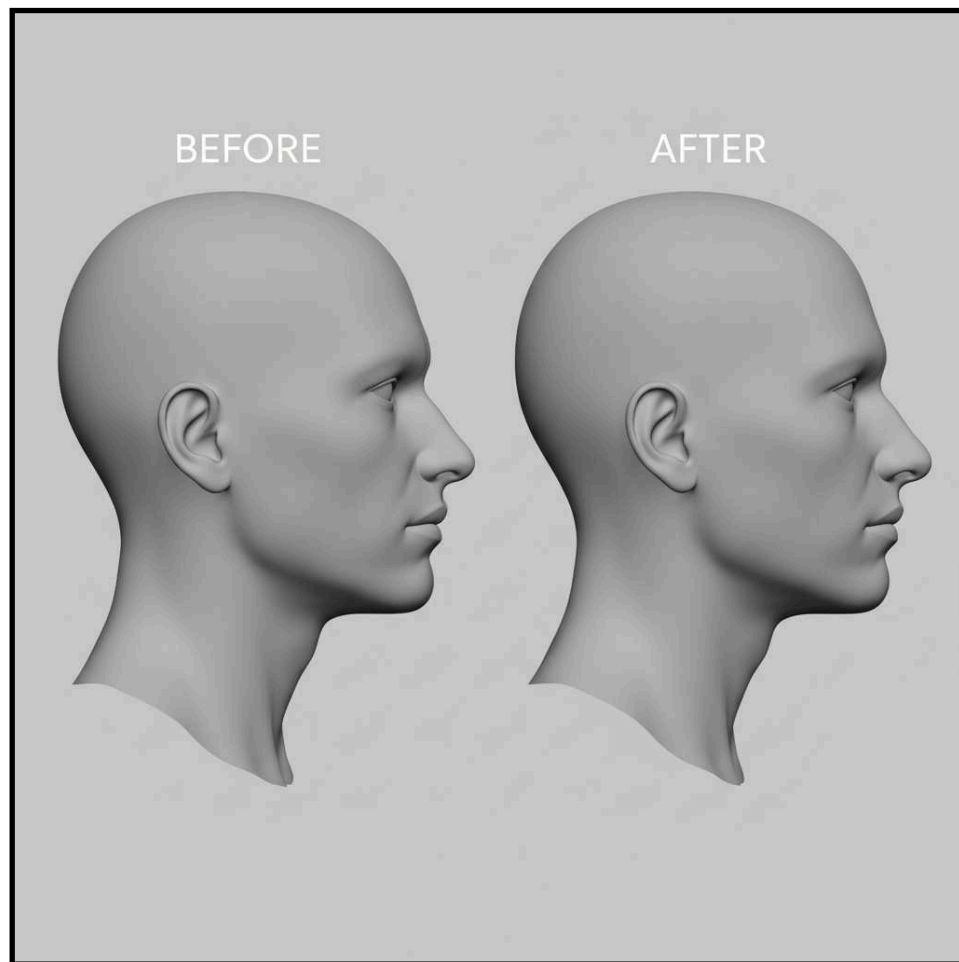

The "Dry Swallow" Hold

This is the most functional exercise for the styloglossus. Initiate a swallow, but pause at the very peak, when your

tongue is pressing up and back against your soft palate to push the (non-existent) bolus down your throat. Flex this position after you hold it, you can do a count of fifty.

Hold the contraction for thirty seconds, strain yourself as much as possible, eventually push for two minutes

What This Does:

Inferior Longitudinal Muscle

The key function of the Inferior Longitudinal is to curl the tongue tip downward and help shorten the tongue. Therefore, exercises involve isolating this specific movement.

Tongue Tip Depression (Primary Exercise)

Open your mouth slightly. Keep the body of your tongue flat and relaxed. Isolate and press only the tip of your tongue firmly down against the back of your bottom front teeth. Hold this contraction for 3 seconds. You should feel

a slight fatigue or "burn" along the underside of your tongue.

Beginner: 30

Intermediate: 50

Expert: 70

OPERATOR NOTES: PLENTY OF OTHER TONGUE WORKOUTS ALSO HIT THIS TONGUE, SO WE SHOULDN'T HAVE TO WORRY TOO MUCH ABOUT THIS MUSCLE

Palatoglossus

Location: It forms the anterior faucial pillar—those vertical ridges of tissue you see in front of your tonsils when you open wide and say "Ahhh."

What it Does: It acts like a sphincter or a drawstring. By simultaneously raising the tongue and lowering the soft palate, it closes off the oral cavity from the oropharynx. This is essential for:

Swallowing: It prevents food / liquid from prematurely spilling back into the throat before you're ready to swallow.

Speech: It helps in the production of guttural sounds and prevents nasal air emission during non-nasal sounds (like /k/, /g/).

Key Difference: It is the only tongue muscle not innervated by the Hypoglossal Nerve (CN XII). It is supplied by the Vagus Nerve (CN X) via the pharyngeal plexus, linking it directly to swallowing and gag reflexes.

The "Gargle" Hold (Most Effective Exercise)

Take a small sip of water. Tilt your head back slightly and prepare to gargle, but do not let the air bubble through. Hold the water in the very back of your throat, feeling the muscles at the back of your tongue and soft palate engage to create a seal. Hold this sealed, contracted position for 5-10 seconds. Swallow normally.

Beginner: 10

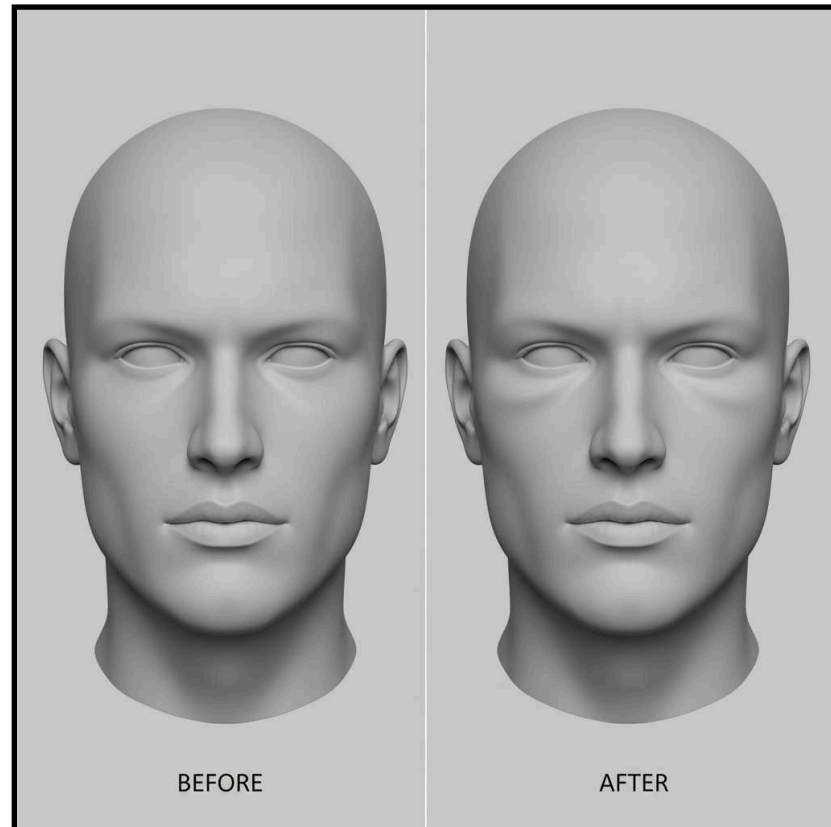

Intermediate: 20

Without Water: You can practice the same muscle action without water, mimicking the initial stage of a gargle.

What This Does:

This effect is extremely exaggerated to showcase what it does

The "Dry Swallow" with Resistance

Place the tip of your tongue on your hard palate (the spot for "N" sound). While keeping the tip anchored, perform a forceful dry swallow. Focus on the intense squeezing sensation you feel in the back of your tongue and throat (the palatoglossal arches). This is the Palatoglossus and other pharyngeal constrictors at work.

Yawning with Tongue Engagement

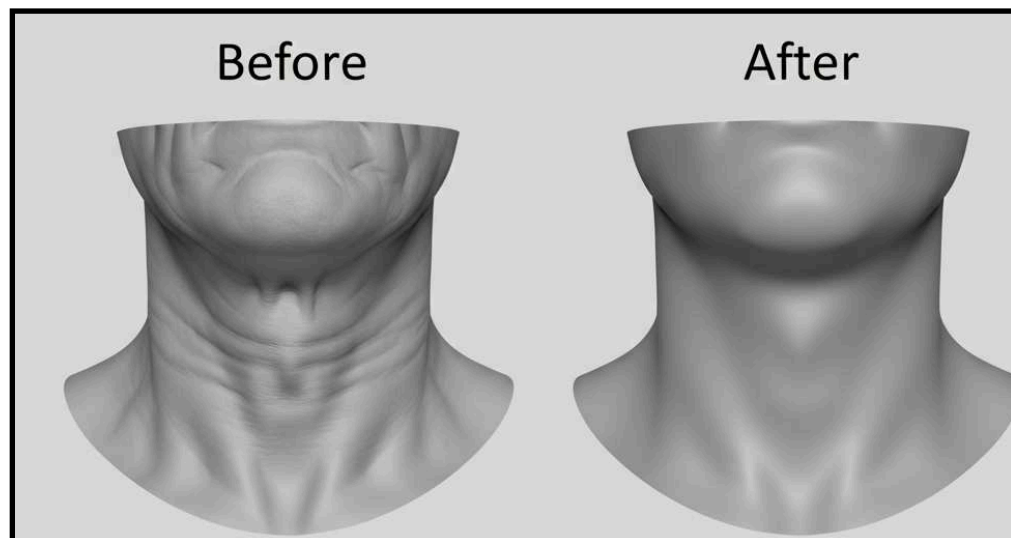

Initiate a yawn, but do it slowly and with control. As you yawn, consciously try to push the back of your tongue downward against the floor of your mouth. You will feel a profound stretch and engagement in the very back of the tongue and the pillars. This directly targets the Palatoglossus. Hold for 3 seconds at the peak.

Beginner: 20

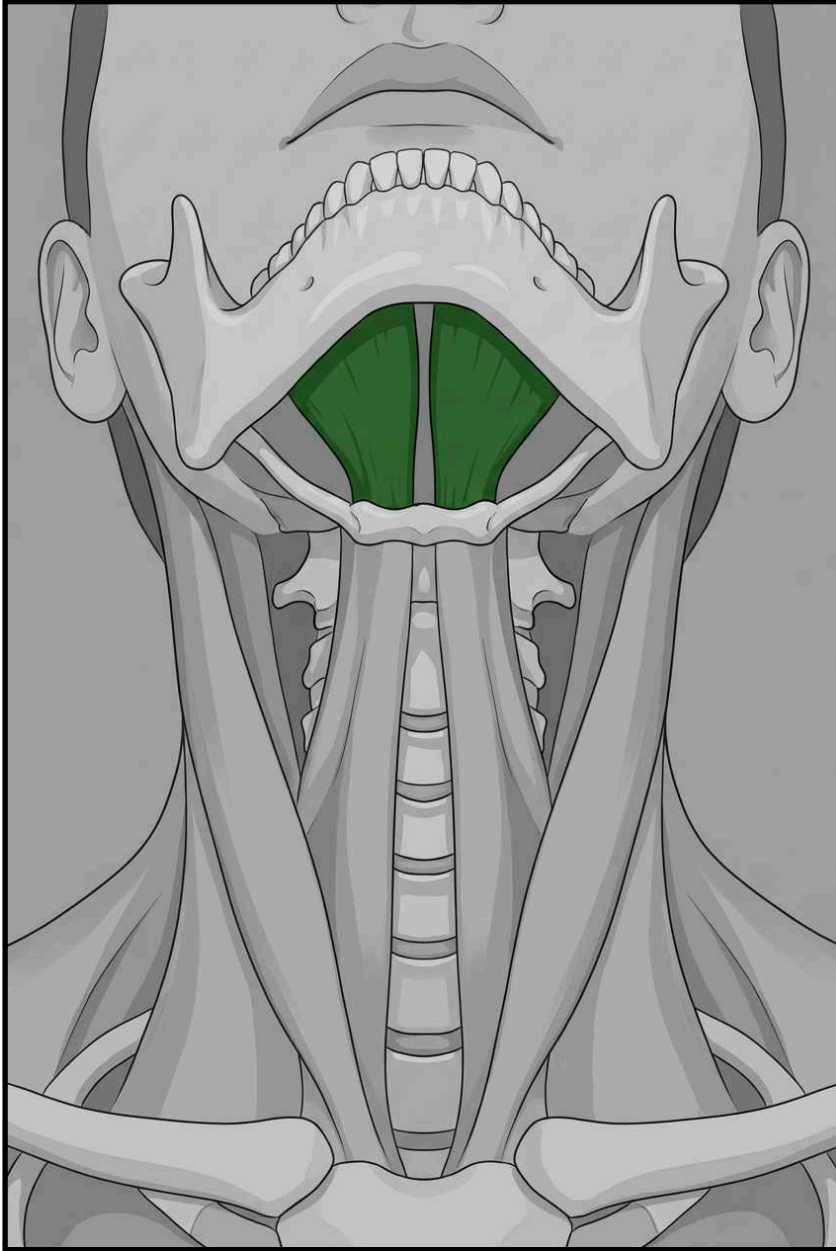

Intermediate: 40

Expert: 50

*What This
Does:*

Genioglossus

One of the most underworked muscles in the face and body

Tongue Pull Back

Open mouth wide (helps to look in the mirror), pull the tongue back, repeat.

Beginner: 20

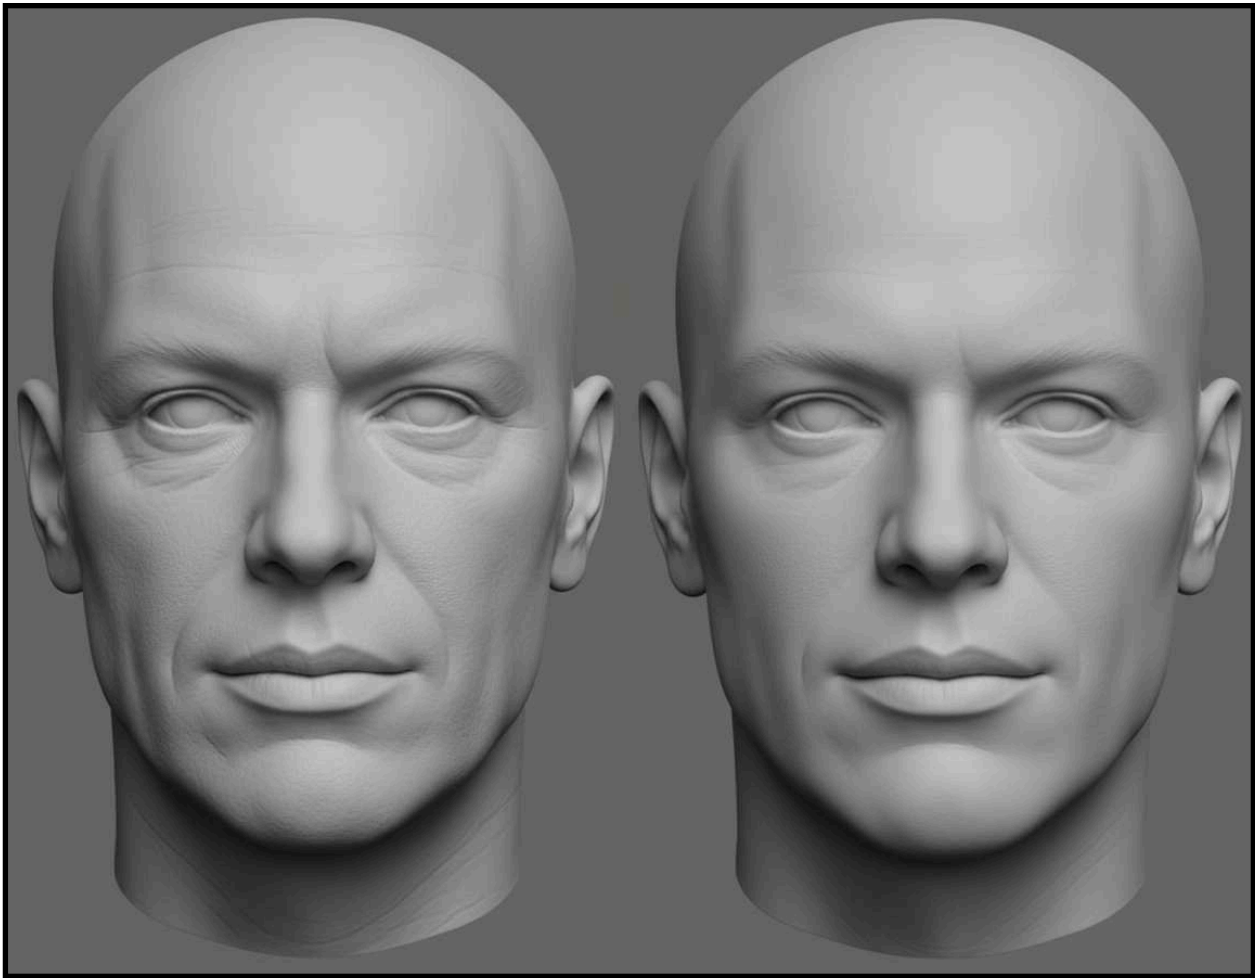

Intermediate: 30

Expert: 50

A WHOLE MINI FACE LIFT.

What This Does:

OPERATOR NOTES: CREATES

The effect is extremely exaggerated

Tongue Pull Back

Tongue against the roof of the mouth, strictly and hold it there, two thumbs under chin, press down with the chin. You should feel your tongue pulling back slightly as it slides against the roof of your mouth.

Beginner: 25

Intermediate: 50

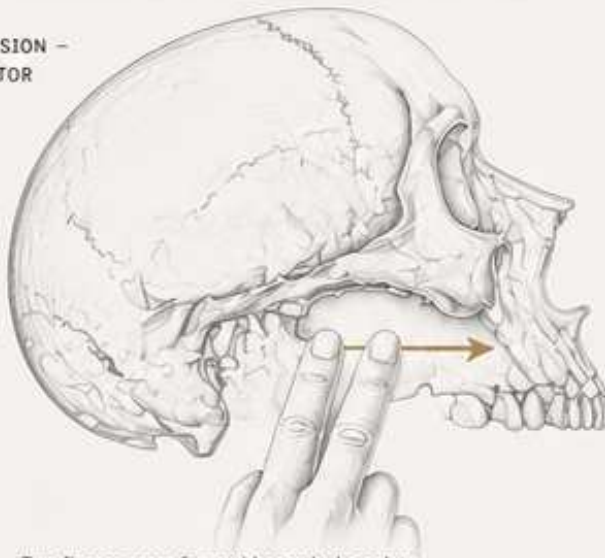

What This Does:

Massages: None

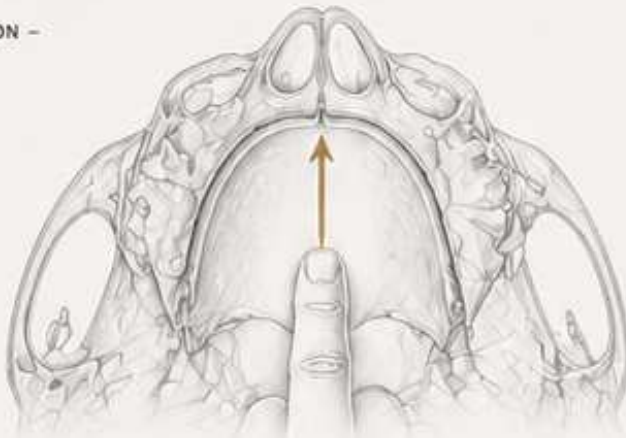

Refinement:

**PALATE EXPANSION –
FORWARD VECTOR**

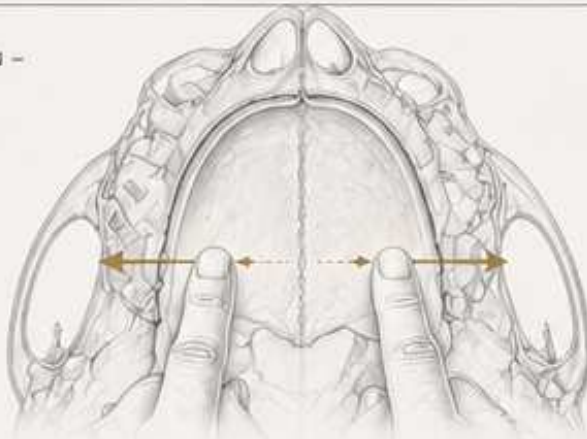

Two fingers press forward beneath the palate.
Arrow: forward (subtle gold)
Apply controlled pressure beneath the anterior palate.
Drive the structure forward.

**PALATE EXPANSION –
VERTICAL LIFT**

Inferior view of the palate (clean, symmetrical).
One finger presses upward into the center.
Arrow: vertical (gold)
Press into the central dome.
Elevate toward the nasal floor.

**PALATE EXPANSION –
LATERAL SPREAD**

Two fingers pushing outward from midline.
Arrows: left + right (gold)
Expand from center outward.
Maintain symmetry.

**NYX'S
SUPERTIPS**

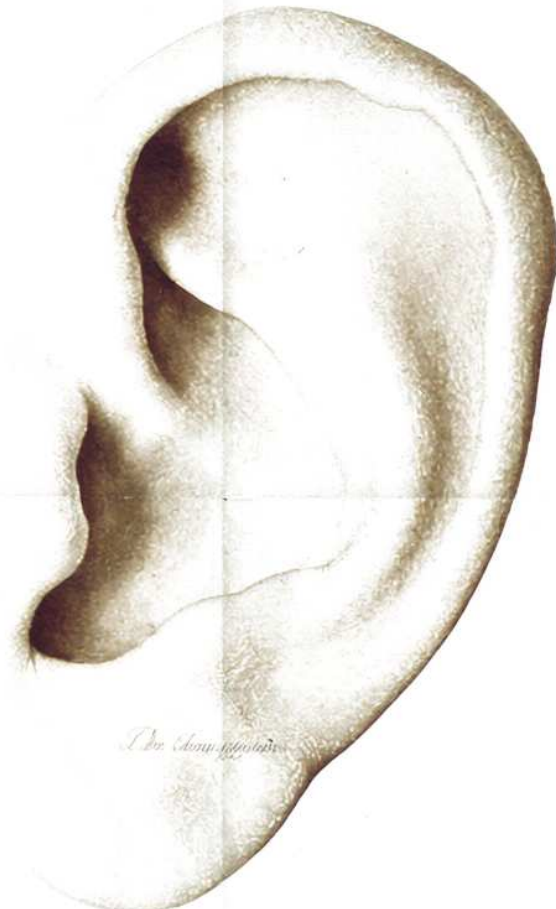

Start at 15 seconds, work your way up to 30 seconds and up to a minute and half.

The Anatomy of the Ear

The Propulsive Oars

Think of the most beautiful face you can imagine. Now picture that same face with large, protruding ears.

The spell is broken.

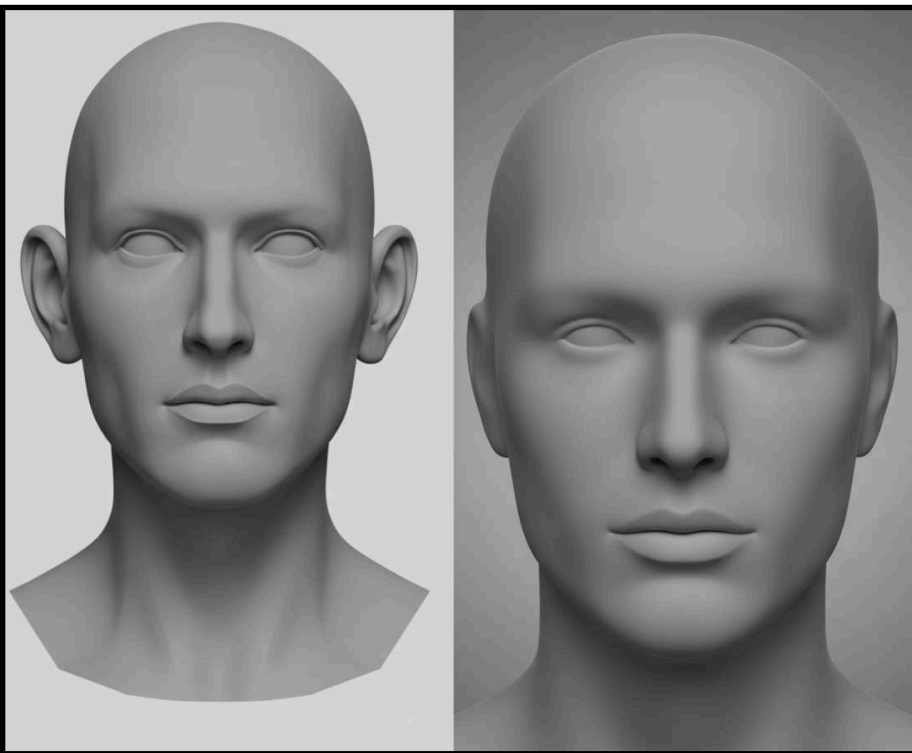

Now picture an already attractive face with small, elegantly set ears. Instantly, they become arresting—complete.

Ears are not passive anchors; they are the propulsive oars of the face.

In our primal past, *our ears were dynamic tools for survival*—constantly rotating to track the faintest sounds in the dark, moving with a subtlety and strength that activated a network of muscles along the jaw, neck, and scalp.

Chapter 9: The Ears

9.0 - The Side Profile Muscles

Just like any other muscular system, the supporting structures of the ears can weaken and atrophy from disuse. This loss of tone allows the ears to sag and protrude, creating an aged, simian-like silhouette that drags the entire

facial aesthetic down. However, by strategically strengthening and stimulating these tissues through targeted massage, we can reverse this decline, lifting the

ears to create a tighter, more refined, and youthful anchor for the face.

Muscular Exercises

Temporoparietalis

This muscle lies above the ear, between the frontalis (forehead muscle) and occipitalis (back of the scalp). Part of the epicranial aponeurosis (galea aponeurotica), blending with the scalp muscles. It is thin and sheet-like, with fibers running vertically toward the scalp.

Function of the Temporoparietalis

While vestigial in humans (reduced from evolutionary ancestors), it still contributes to:

- Scalp Movement:
 - Assists in raising the ears slightly
 - Tightens the scalp, working with the frontalis and occipitalis.
- Facial Expressions:
 - May subtly aid in expressions like surprise or fear by lifting the scalp.
 - Helps anchor the auricularis muscles (ear muscles) and stabilizes the galea aponeurotica.

OPERATOR NOTES: THIS MUSCLE REMOVES FOREHEAD LINES, RAISES THE EAR UP, MAKING IT LOOK SMALLER AND CONTRIBUTES TO A “YOUTHFUL” LOOK - VERY HARD TO DO.

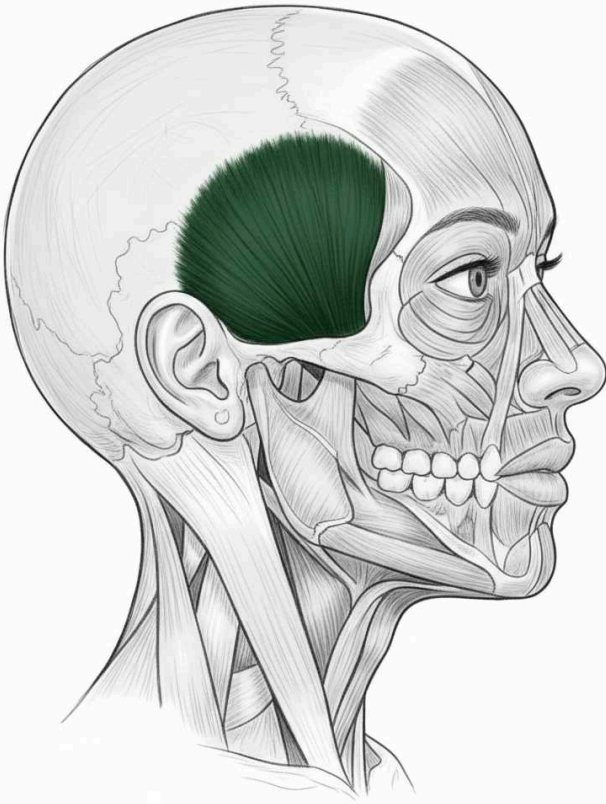

Ear Wiggling (For Activation)

Sit in front of a mirror. Attempt to raise your ears upward without moving eyebrows. You can hold for 3–5 seconds, relax.

Beginner: Repeat 10

Scalp Slides

Place palms flat on the sides of your scalp (above ears). Gently push the scalp forward and backward (like adjusting a wig). Resist the motion back and forth as you go, either one movement forward - or backward can count as a rep or the entire range of movement induced can count as a rep.

Beginner: 10

Intermediate: 20

Expert: 30

Resistance Training (Indirect)

Press fingertips lightly against the temples. Try to raise your eyebrows while resisting with your fingers. Feel the temporoparietalis engage subtly.

Beginner: 30

Intermediate: 50

Expert: 70

Temporalis

Primary Action: Elevates the mandible (closes the jaw).

Secondary Action: The posterior (rear) fibers retract the mandible (pull the jaw backward).

The Isometric Temple Clench

Place your fingertips lightly on your temples to feel the muscle engage. Clench your teeth together firmly, focusing on squeezing the temporalis muscle in your temples. You

can hold the clench for 5-10 seconds. Completely relax your jaw for 2-3 seconds.

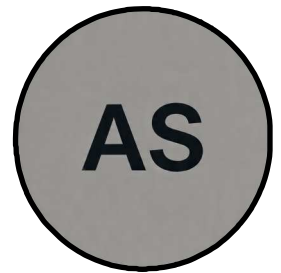

Beginner: 20

Intermediate: 30

Expert: 50

Resisted Jaw Retraction (The Key to Temple Engagement)

This is the most important exercise for targeting the posterior fibers.

Place a 1-2 inch thick object between your back molars (a rolled-up washcloth, a specific jaw exerciser, or a wine cork). Bite down on the object. Now, while biting down, try to pull your entire jaw backward as if you're trying to align your molars perfectly. You are fighting against the object in your mouth. You will feel an intense contraction

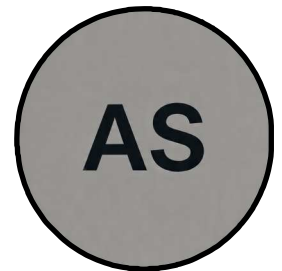

deep within your temples. This is the temporalis engaging.

Hold for 5 seconds, relax.

NYX DIRECTIVE

Place fingers behind the jaw, on both sides, whichever side feels more lopsided, work out only that side! That

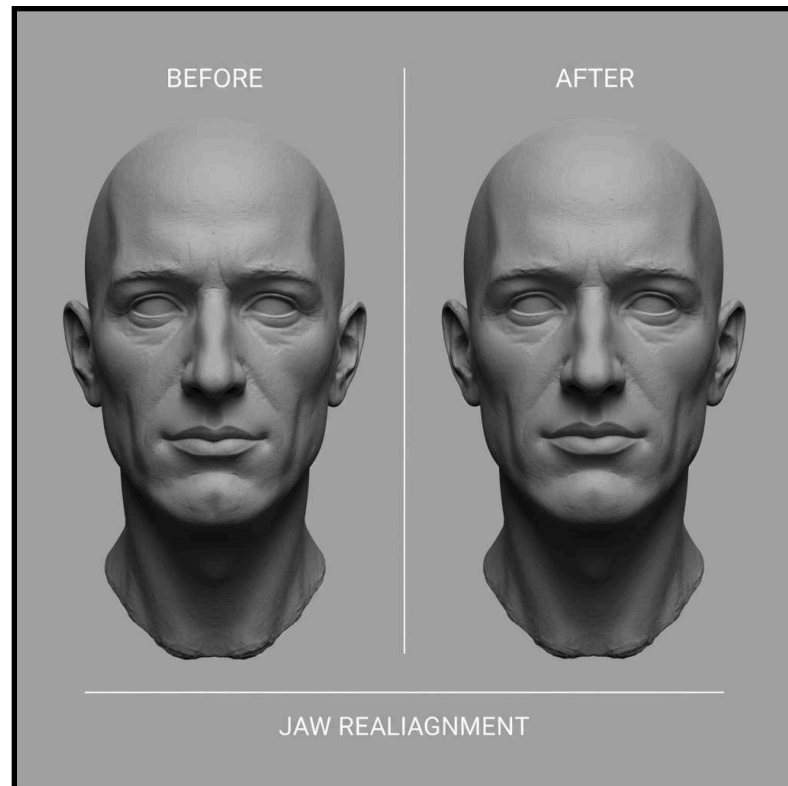

way, your jaw will automatically adjust and become more symmetrical, it is a jaw muscle issue - but at it's core it's actually a Temporalis weakness issue or where one side is more dominant than the other. Then do a second set, with fingers behind on both sides - and a third, until when you push back your jaw into your fingers, you can feel the tension wrapped around your head like a headband and the push back feels equal on both sides - Your jaw is now even. May take a few workouts.

What This Does:

Functional Training: Deliberate Chewing

How: Chew a tough gum (like mastic or Falim gum) slowly and deliberately for

10-15 minutes. Focus on using a full range of motion and feeling the temporalis engage with each bite, especially during the retraction phase of the chewing cycle.

The Critical Cooldown: Stretching & Relaxation

The temporalis is a common source of tension headaches and TMJ discomfort. Never skip the stretch.

The Yawn Stretch:

Open your mouth as wide as you comfortably can, as in a big yawn.

Hold for 20-30 seconds, feeling the stretch in your temples and jaw.

Repeat 3 times.

Manual Temples Massage:

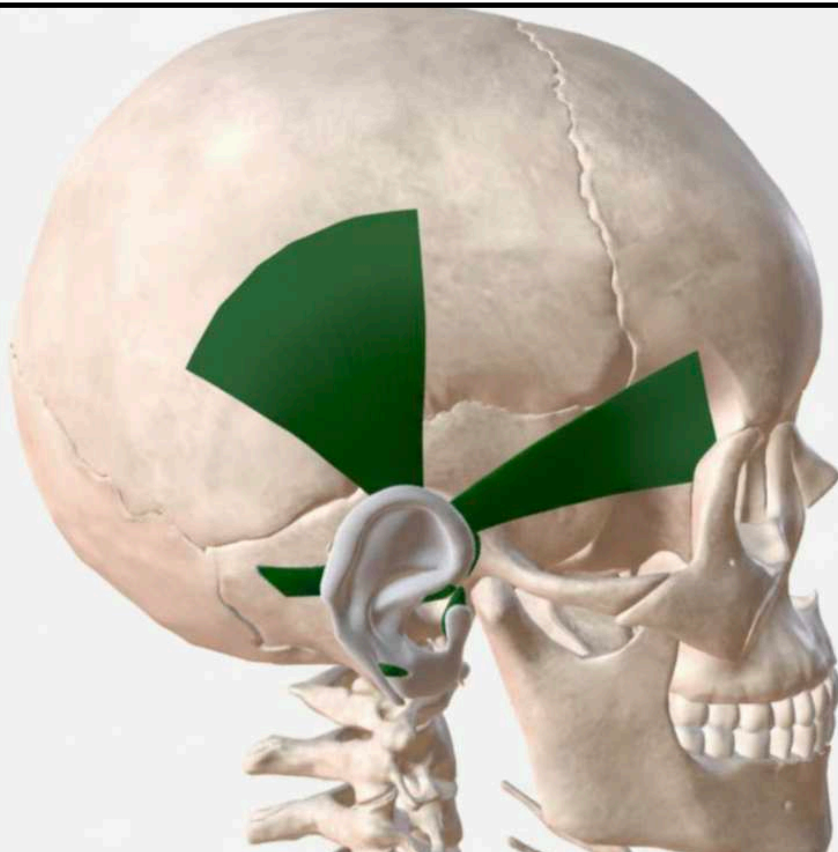

Use your fingertips to apply deep, circular pressure to your temples for 60 seconds post-

Avoid Overtraining: The temporalis is a powerful muscle used constantly. Training it more than 3 times a week can lead to strain and TMJ issues. Listen to your body.

Symmetry: If one temple feels weaker, focus on the mind-muscle connection on that side during your exercises.

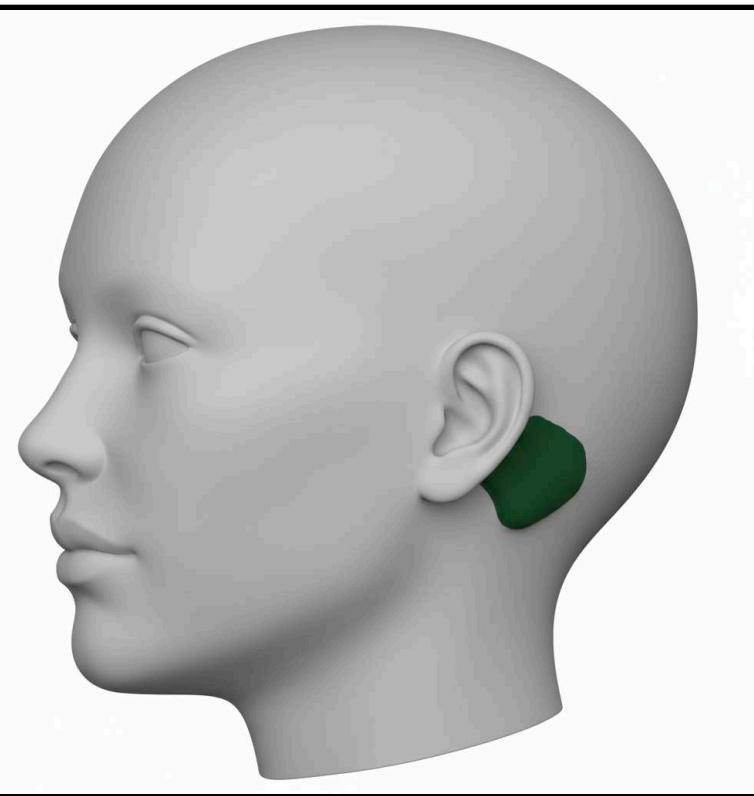

Why This Matters: A well-developed temporalis fills out the temples, preventing a hollow, aged appearance. It

provides a strong, balanced jawline and is essential for overall jaw stability and health.

9.1 - The Auricular Muscles

There are three auricular muscles; posterior (behind), superior (above) and anterior (forward). Working all three of these is the key to developing, strong, leveled ears. These will also help “tighten” the face, providing a look of youth.

Auricularis Posterior

Location: It is the rear auricular muscle, located behind the ear. It runs from the mastoid process of the temporal bone (the bony prominence behind your ear) to the cranial root of the auricle (the base of the ear

itself).

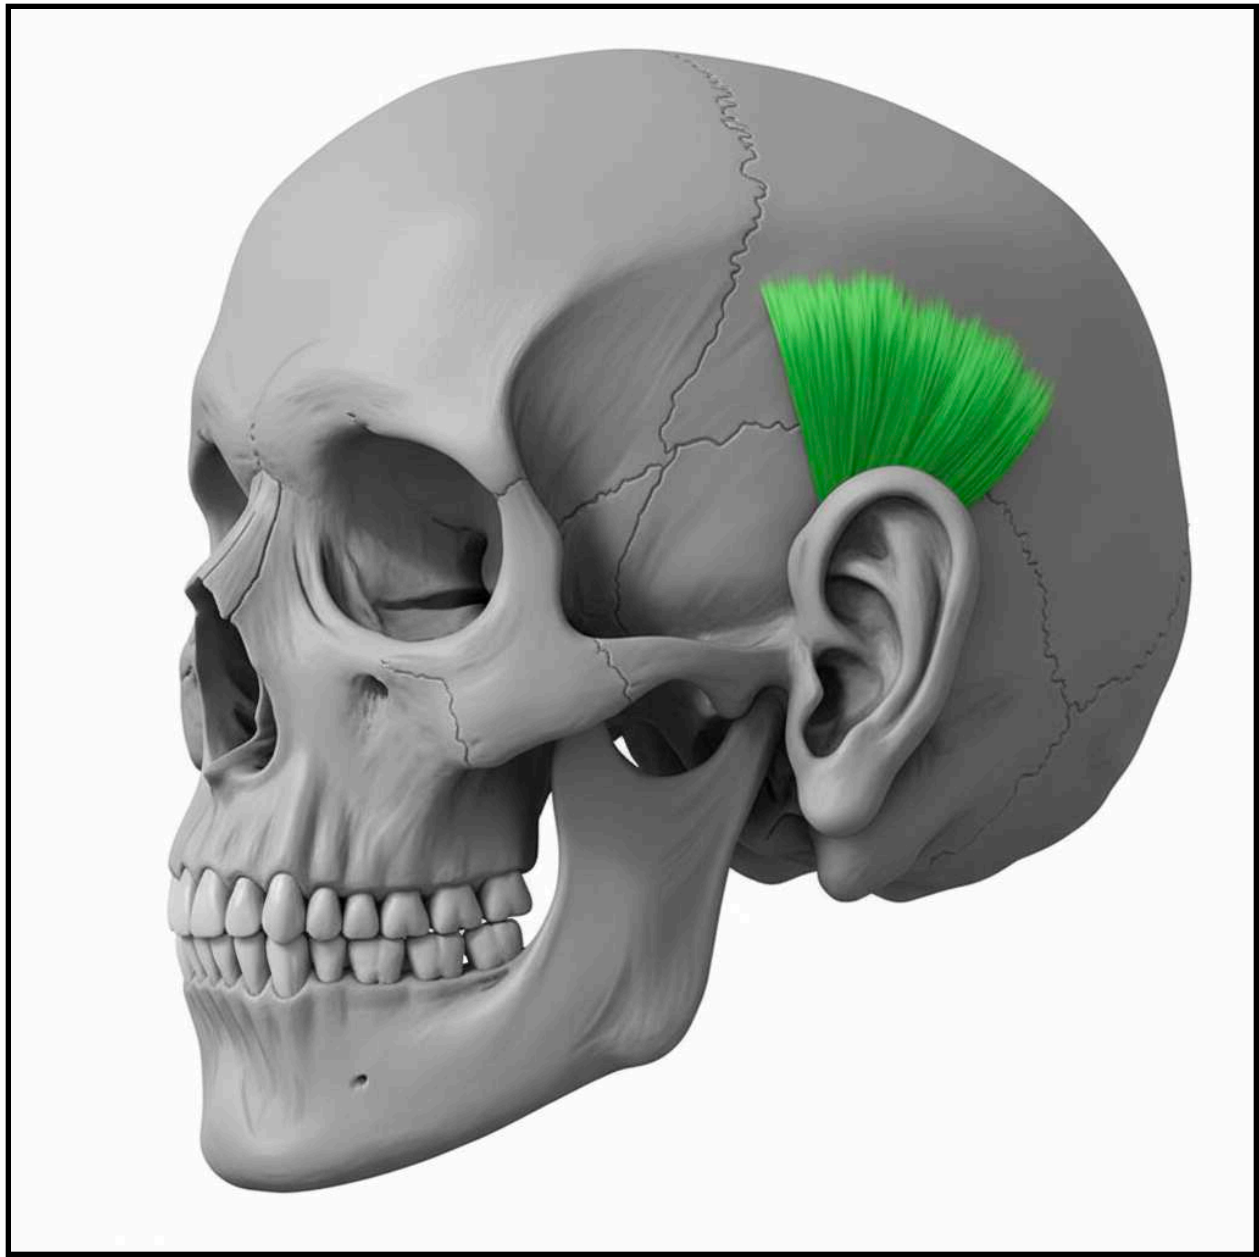

Function: Its primary action is to pull the ear backward. In our evolutionary ancestors who could pivot their ears to locate sounds, this muscle was crucial. In modern humans, it is considered a vestigial muscle, meaning it has lost most of its original function.

The "Ear Wiggling" Learning Protocol

Place your fingers firmly on the area behind your ear. Try to make your ears move. Even if you can't, you might feel a faint twitching under your fingers. This is the muscle attempting to fire. I just push my ears back, directly onto the fingers and repeat.

Use a Mirror:

Watch your ears closely in a mirror as you try different subtle movements of your scalp, eyebrows, and the skin around your ears.

Beginner: 20

Intermediate: 30

Expert: 50

OPERATOR NOTES: ABSOLUTE BALLER EXERCISE, THIS ONE EVENS OUT THE EARS. JUST SIT THERE AND DO IT TILL IT BURNS, THEN LOOK IN THE MIRROR AND OBSERVE YOUR EYES, THEN EARS, NOTICE HOW THEY STRAIGHTEN OUT AFTER DOING AS MANY REPS AS YOU CAN. YOU'RE WELCOME.

Auricularis Superior

Function: Elevates the ear (pulls it upward).

How to Locate It: Place your fingertips directly above your ear, on your scalp. The muscle feels like a thin band running vertically.

The "Surprised" Scalp Lift

Without raising your eyebrows, try to lift the skin and tissue directly above your ears upward toward the top of your head. Imagine you are trying to create a "devil horn" or a pointed ear tip. The movement is extremely subtle. You can hold the sensation of lifting for 3-5 seconds, I just go for fast repetitions.

As You Advance:

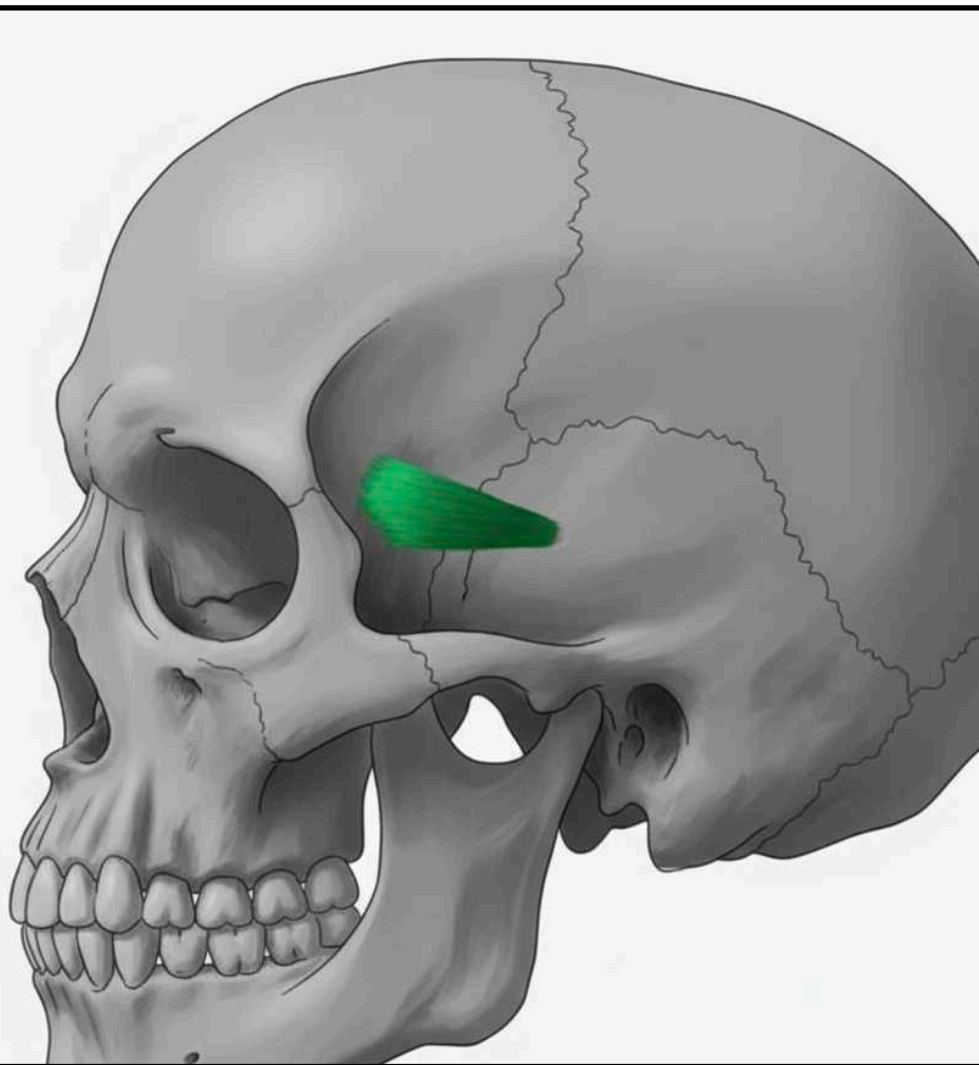

Use your hands to create resistance. You can also tuck a finger under the fold of the ear where the top of the ear meets the skull. That will simply cause the muscle to "burn", it's a real zinger.

Beginner: 20

Intermediate: 40

Expert: 70

OPERATOR NOTES: DON'T BE AFRAID TO "PULL" THE MUSCLE VERY HARD. YOU'RE GOING TO STRAIN AND GRIT YOUR TEETH. THIS IS GOOD, THIS IS A TOUGH MUSCLE TO ACTIVATE. THIS WILL TRULY STRAIN THE NECK MUSCLE AS WELL, AND THAT'S FINE.

Auricularis Anterior

The "Forward Glide":

Imagine you are a cat or dog pivoting its ears forward to catch a sound. Try to pull the entire

ear structure forward, toward your eye. You will likely feel the skin in front of your ear tighten. This is the Auricularis Anterior engaging. Hold for 3-5 seconds, relax.

As You Advance:

Use your hands to create resistance. You can put two fingers in front of the ear, you will definitely feel this muscle.

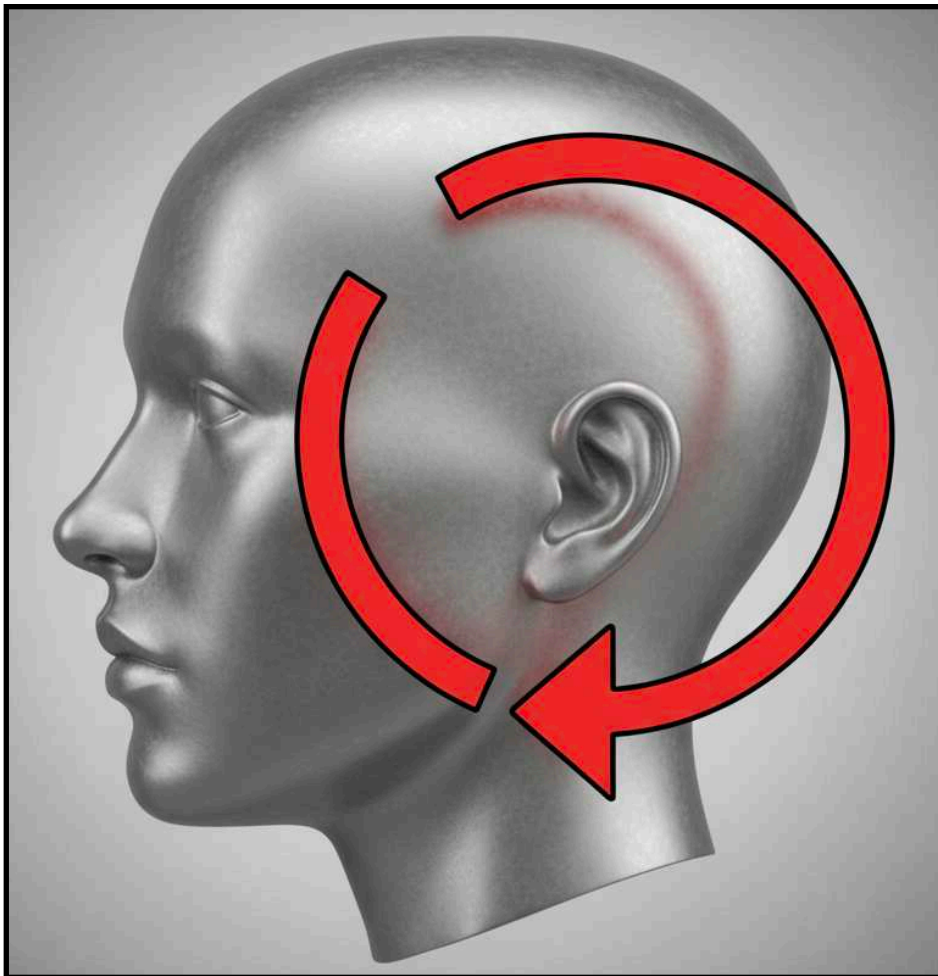

Beginner: 20

Intermediate: 40

Expert: 70

Leveraging the Temporalis:

Clench your jaw slightly to feel your temporalis muscle bulge in your temple. While maintaining a very light clench, try to direct the tension forward to pull the skin in front of your ear. This uses the connected facial fascia to help initiate the "forward pull" sensation.

The Ultimate Challenge:

Coordination for Ear Wiggling

Once you can isolate each muscle, the final step is to coordinate them in sequence or rhythm. The "Ear Clock": Imagine your ear is the center of a clock.

- 12 O'Clock: Auricularis Superior (Lift)
- 3 O'Clock: Auricularis Anterior (Pull Forward)
- 6 O'Clock: Relax and let the ear return to neutral.
- 9 O'Clock: Auricularis Posterior (Pull Backward - from our previous discussion)

Practice moving your ear to each "hour" slowly and deliberately.

Eventually, try to create a smooth, wiggling motion by rapidly alternating between the Superior and Posterior muscles.

OPERATOR NOTES: THIS EXERCISE IS PRACTICALLY IMPOSSIBLE TO PULL OFF, WHAT I DO IS PLACE MY FINGERS INSIDE MY EARS AND THAT WAY ROTATE THEM AROUND. THIS HELPS LOOSEN UP THE TISSUE AND PLACES THE EARS IN A GOOD POSITION.

9.3 - The Two Intrinsic Ear Muscles

They are located deep within the temporal bone, behind the eardrum, in the air-filled space called the middle ear.

Tensor Tympani

Attached to the malleus (hammer) bone, which is connected to the eardrum. Tenses the eardrum (tympanic membrane). This dampens low-frequency sounds, protecting the inner ear from damage caused by loud noises (like your own voice, chewing, or thunder).

Stapedius

Attached to the stapes (stirrup) bone, the smallest bone in the body. Stabilizes the stapes bone. This dampens the vibration of the entire ossicular chain, providing protection from high-frequency sounds (like a sudden scream or machinery).

The "Acoustic Reflex"

These two muscles work together involuntarily in a reflex arc: When a loud sound (typically over 80 dB) is detected, your brain triggers the acoustic reflex, causing both muscles to contract. This stiffens the entire ossicular chain, reducing the intensity of sound vibrations passed to the delicate inner ear (cochlea).

How to Try and Activate It:

- The "Squeeze" Method: Close your eyes very tightly and squint hard. You might hear a low rumble. This often engages the tensor tympani.
- The "Yawn" Method: The beginning of a wide yawn can sometimes trigger the muscle.
- The "Voluntary Rumble": If you have the ability, try to create the rumbling sound without any other facial movement. It feels like flexing a muscle deep inside your head.

OPERATOR NOTES: YOU CAN DEFINITELY FEEL THESE MUSCLES IN THE EAR CANAL. IT'S TOTALLY ABSTRACT, THESE MUSCLES ARE SIMPLY "ACTIVATED" TO

HELP PROTECT YOUR HEARING AS YOU AGE, THEY WON'T HELP IMPROVE YOUR LOOKS OR DO MUCH BEYOND THAT, BUT THEN AGAIN, I'D LIKE TO THINK HEARING IS PRETTY IMPORTANT.

OPERATOR NOTES: YOU CANNOT "STRENGTHEN" THESE MUSCLES IN A TRADITIONAL SENSE. ANY "WORKOUT" IS PURELY ABOUT NEUROMUSCULAR CONTROL—SEEING IF YOU HAVE, OR CAN DEVELOP, VOLUNTARY COMMAND OVER AN OTHERWISE INVOLUNTARY REFLEX.

Massages

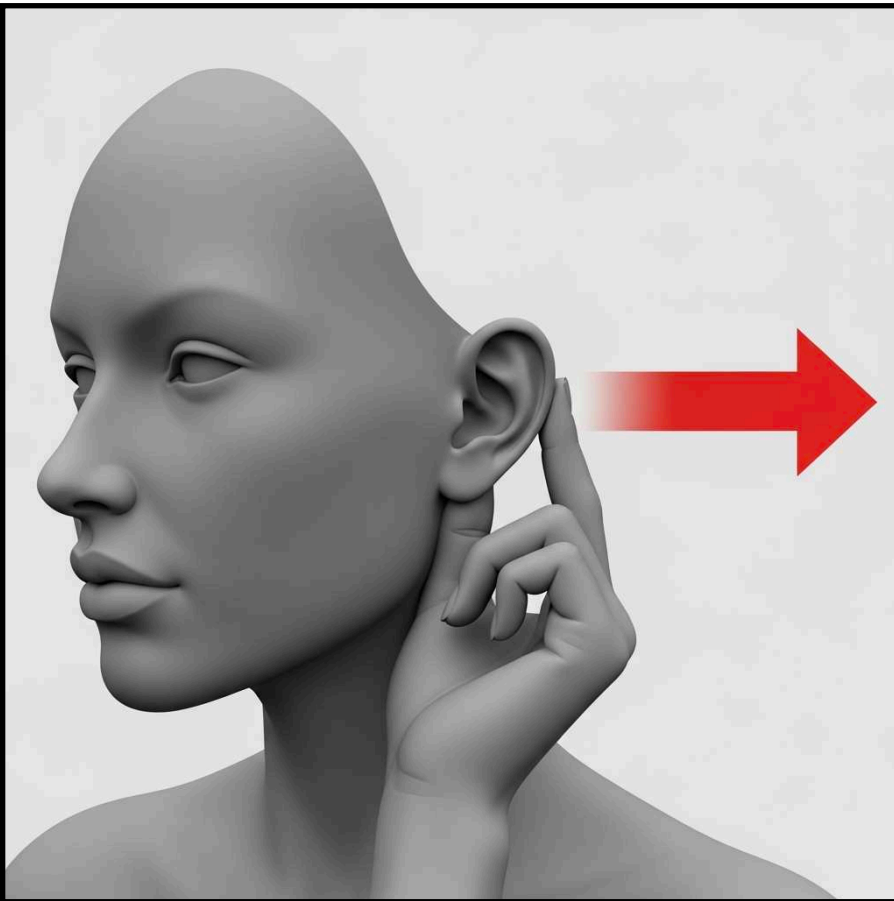

9.4 - The Ear Massages

Our Ideal:

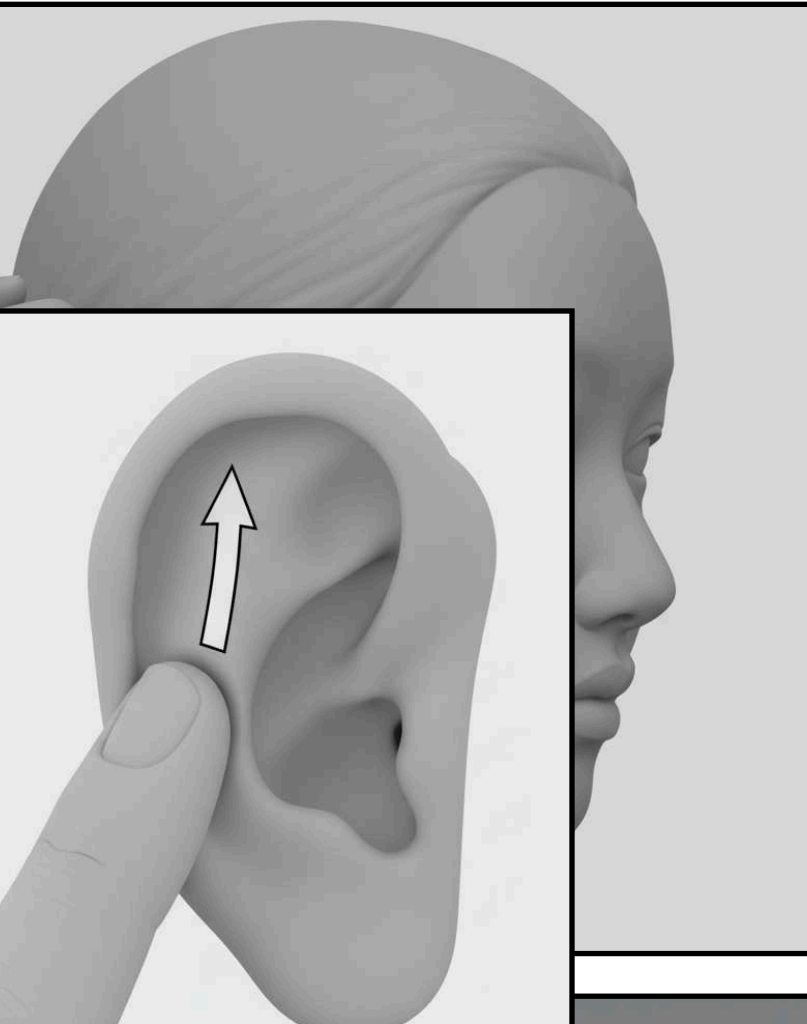

While we can't literally reshape our ears into perfect elf-like points, we can certainly sculpt them toward that ideal: a lifted, tapered tip that conveys youth and vitality. Furthermore, since elongated ears are a telltale

sign of aging, the following massages are designed to combat that sagging, helping you maintain a tighter, more youthful contour.

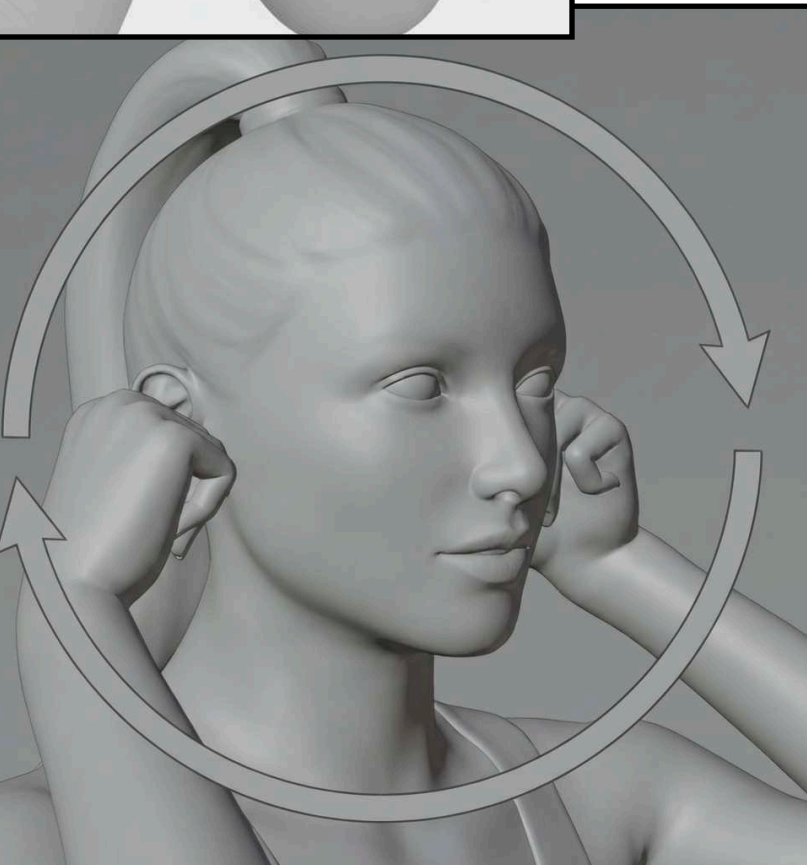

Massage #1 is easy, just pinch the ear and pull it away from the face. Try it fifty times.

Massage #2 is simple, simply grab the ear with the palm - and push it up - gently. Do this fifty times. This will help reposition the ear. If you use oil, it will rather help reshape the ear, without oil it's a stronger movement.

Massage #3 - simply pinch the folds of your ear together, this will help drain a lot of fluid and make the ears more “versatile” and moveable.

OPERATOR NOTES: YOU CAN CRUSH TOGETHER THE EAR WITH YOUR FINGERS AROUND IT OR PALM IT, THE GOAL IS TO “COMPACT” THE TISSUE OF THE EAR AS THE EAR ALWAYS GROWS THE OLDER WE GET.

Massage #5 involves grabbing the ears and rotating them around in a circular like fashion, giving them a sense of motion, loosening up the tension there and relaxing. It is purely a “wind down” massage afterwards.

Refinement

Massage #4 is the most important ear massage of all, it is to sculpt our ears into that “eleven tip”. Guide a well-oiled finger into the helix or top of your ear, hook it, drag the ear up and let the finger slip out. Do it 100 times. You will not notice the benefits right away, this one takes time to compound.

OPERATOR NOTES: YOU CAN USE ONE FINGER AGAINST THE TIP, TWO FINGERS WITHIN THE EARS OR PINCH AND JUST ADJUST IT FROM THE TOP, IT'S ENTIRELY UP TO YOU AND YOUR SHAPE OF YOUR EAR AND WHAT'S COMFORTABLE FOR YOU.

The Dignity of the Neck

A long, elegant, and strong neck is a royal seal. It is an exposed, vulnerable column that paradoxically broadcasts supreme confidence. It allows you to tilt your gaze above others, surveying the world from a position of grace, even if you are shorter in stature.

Your neck is your social fulcrum. It is the muscle of dignity, subtly indicating your place without a word. A weak, strained, or shortened neck pulls you into the posture of toil. A strong, elongated neck lifts you into the posture of command.

The neck is the most important part of the face to indicate royal social status.

Chapter 10: The Neck

10.0 - Creating a stable foundation for the head

The neck is an intricate latticework of muscles, arguably the most complex kinetic system in the human body. As you progress in rejuvenating your face, you'll discover a critical truth: every facial expression and muscular flexion transmits tension to the neck. An underdeveloped neck will betray your efforts by crinkling, creasing, and revealing your age—the exact opposite of your goal. Therefore, neck training is non-negotiable. We must forge a neck that is not only strong and resilient for ideal posture, but one that moves with the silent, elegant grace of a supporting actor, seamlessly integrating with the facial musculature to present a unified, youthful front.

The Neck can be divided into two categories:

Front Muscles:

- Anterior Neck Muscles (Front of the Neck)
 - These are primarily involved in swallowing and speaking.
- Suprahyoid Muscles (Above the hyoid bone - elevate the hyoid / larynx)
 - Digastric: Has two bellies; depresses the mandible and elevates the hyoid.
- Stylohyoid: Elevates and retracts the hyoid.
- Mylohyoid: Forms the floor of the mouth; elevates the hyoid and tongue.
- Geniohyoid: (As discussed) Elevates and pulls the hyoid forward.
- Infrahyoid Muscles ("Strap Muscles" - Below the hyoid bone, depress the hyoid / larynx)
- Sternohyoid: Depresses the hyoid bone.
- Sternothyroid: Depresses the larynx (voice box).
- Thyrohyoid: Depresses the hyoid or elevates the larynx.
- Omohyoid: Has two bellies; depresses and retracts the hyoid.

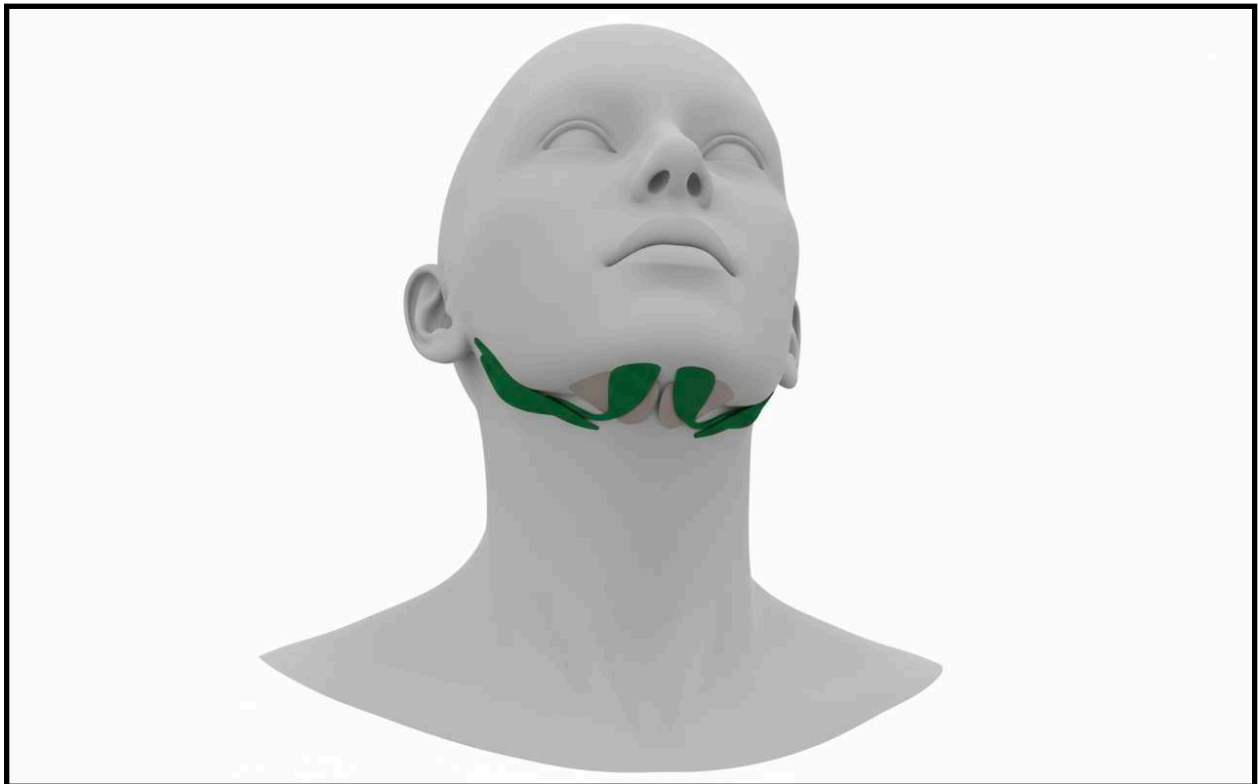

Side Muscles:

Lateral Neck Muscles (Side of the Neck)

These assist in flexion and stabilization.

- Scalene Muscles (Anterior, Middle, Posterior): Located deep to the SCM. They elevate the first two ribs during inhalation and flex/rotate the neck.
- Longus Colli & Longus Capitis: Deep flexor muscles that stabilize and flex the cervical spine.

Muscular Exercises

10.1 - Suprahyoid Muscles

We will not spend time on the individual muscles but work them out as a whole, as this is more than good enough to prevent a “turkey neck” which is the point of these exercises.

The Chin Tuck Isometric (The Foundation)

Sit or stand tall against a wall for posture feedback. Perform a double chin motion: pull your chin straight back, keeping your head level. Do not look down. Once fully tucked, place two fingers under your chin.

Try to push your chin downward against your fingers while maintaining the tuck. You will feel a powerful burn under your chin.

X20, three sets

Expert: X20, three sets with finger resistance

OPERATOR NOTES: THIS IS AN EXTREMELY HARD EXERCISE TO DO, SINCE THERE IS MUCH IMBALANCE GENERALLY IN OUR FACES FROM EATING ON ONE SIDE. IT'S RATHER DISASTROUS. THE BEST BET IS TO DO THIS EXERCISE AFTER SOME STRETCHES, REALLY FEEL YOUR BODY WITH THIS ONE. DO A FEW REPS, STRETCH IT OUT, MAYBE EVEN PUSH AGAINST THE WALL AND STRETCH THE ARMS AND SHOULDERS OUT. THEN CONTINUE. ONLY PLACE PRESSURE ON ONE SIDE. THE SITTING VERSION OF THE STANDING VERSION IS BETTER TO EVEN UP THE UNDERSIDE OF THE JAW. THAT BEING SAID, DON'T UTILIZE YOUR NECK, MERELY YOUR JAW SHOULD BE THE ONE MOVING UP AND DOWN.

Effortful (Dry) Swallows

Sit upright with your tongue in the correct posture (sucked very tightly to the roof of your mouth). Perform an exaggerated, forceful swallow without any food or liquid. At the peak of the swallow, when your hyoid bone is at its highest point, squeeze and try to "push it up".

X15 to x30

The "Hyoid Shrug" (Advanced Isolation)

Place your index and middle fingers lightly on your hyoid bone (the prominent "Adam's apple" area). Without

swallowing, talking, or moving your jaw, attempt to isolate and "shrug" your hyoid bone upward toward your chin. The movement is tiny, but you should feel a deep contraction under your chin. Hold for up to 3 seconds.

x30

The "Tongue Press" Suprahyoid Activation

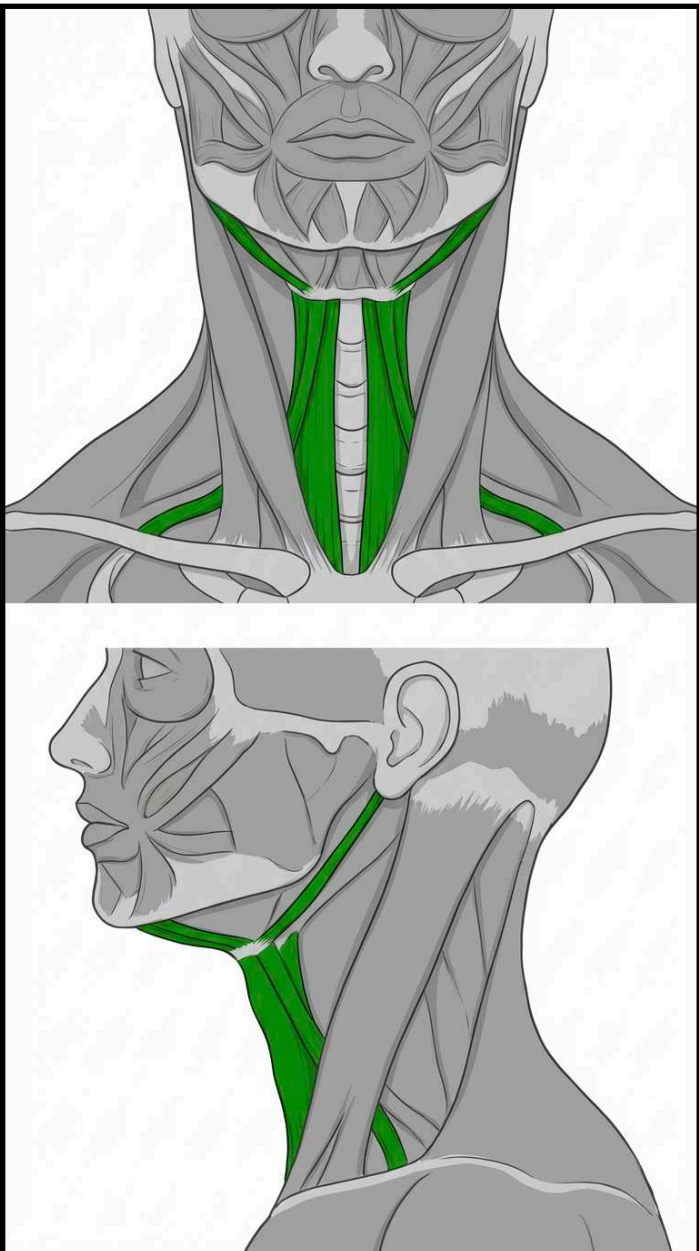

Press your entire tongue firmly against the roof of your mouth. While maintaining this pressure, perform a strong chin tuck. Hold the combined position and then make lots of little movements. You will feel an intense engagement of the entire suprahyoid group. Relax fully. And do another set. You can shift your head slightly to the left and right to hit all muscles.

A proper set is x25, just bang them out

OPERATOR NOTES: THIS REALLY TONES THE NECK, IT DOES CREATE A SORT OF BIGGER UPPER ADAM APPLE APPEARANCE, BUT IN A CUTE AND NORMAL WAY. ALSO HELPS CREATE A LARGE CAVITY UNDER THE CHIN FOR AN EXTREMELY LOOK SIDE PROFILE. HELPS WITH NECK WRINKLES AS WELL.

10.3 - The Front Neck Muscles

Infrahyoid Muscles

Function of the Infrahyoid Muscles

Collective Action: Pull the hyoid bone (and larynx) downward.

Purpose: They anchor and lower the hyoid during swallowing and speaking, and are vital for maintaining the taut, vertical lines of the anterior neck. Weak infrahyoids contribute to a soft, undefined submental (under-chin) region.

The "Neck Tense" Isometric (Foundational Engagement)

Sit or stand tall, looking straight ahead. Relax your jaw and tongue. Place your fingertips lightly on the front of your neck, over your Adam's apple (larynx). Gently and slowly swallow. Feel your larynx rise and then fall. As it falls, consciously try to pull it down further and hold it in that lowered position for up to 5 seconds.

X50 max

Resisted Head Lift (Prone Neck Extension)

Lie face down on a bench or bed, with your head and neck extended over the edge. Start with your head in a neutral position (looking at the floor). Tuck your chin slightly (engaging the deep neck flexors). Slowly lift your neck up and back, extending your neck slightly, while keeping your chin tucked. Do not move your head, this is entirely a neck exercise. This eccentric and concentric load

powerfully engages the infrahyoids to control and depress the hyoid against the pull of gravity.

X30 max

The "Low Note" Hold (For Thyrohyoid & Laryngeal Control)

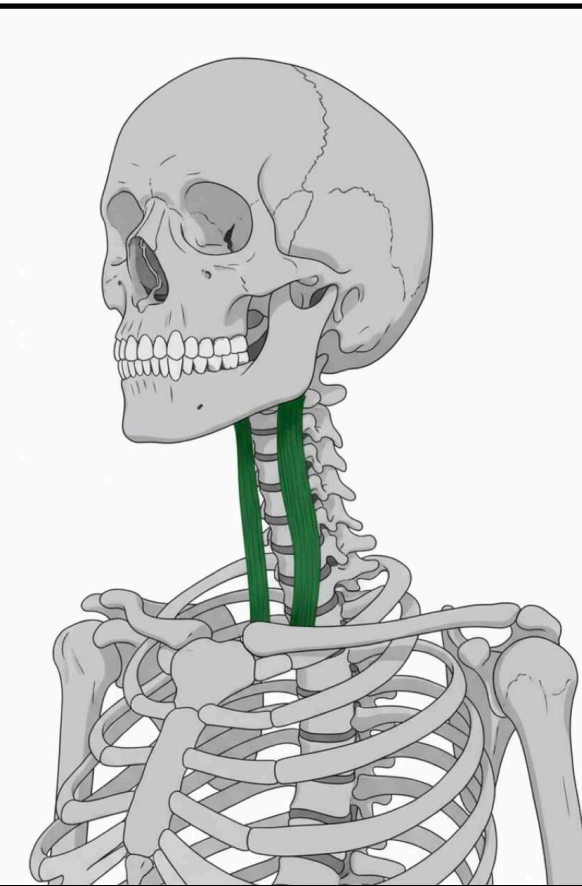

Place your fingertips on your larynx (Adam's apple). Hum or speak in your lowest, deepest possible chest voice. Sustain that note and feel your larynx vibrate low in your neck. To produce this sound, your infrahyoids (especially the thyrohyoid) are actively depressing the larynx. You do not need to hum the whole thing out.

X20 max

Chin Tuck with Hyoid Resistance

Perform a proper chin tuck (head level, chin pulled straight back). Place the pad of your thumbs under your jaw on each side, applying upward pressure on the hyoid bone. While maintaining the tuck, try to depress your hyoid/jaw downward against your thumb's resistance. You can also place your palms on your chest and just do the movement with your head.

X25 max

Longus Colli

The Longus Colli is one of the most important yet overlooked muscles in the body for posture, neck health, and facial aesthetics. It is the deep neck flexor, running along the front of the cervical spine. Strengthening it is non-negotiable for fixing "tech neck,"

reducing jaw tension, and achieving a strong, upright posture.

The Chin Sit-up Or Tuck Isometric (The Foundation)

Sit or stand tall. Looking straight ahead, perform a pure chin tuck: meaning, that you tuck your chin *all the way down* to the actual chest. Do not look down. It will feel like there is a golf ball sized hole between the tip of your cheek and neck. Now, “pump” this sensation, as if you are doing a sit-up, sit-up the head from the neck then back down, short and small movements.

X40, crank out as many sets as you can with long breaks in between

OPERATOR NOTES: THIS HELPS PREVENT A WIDE NECK. YOU CAN PLACE BOTH HANDS ON THE HEAD AND PRESS DOWN TO MAKE IT MORE DIFFICULT.

Wall Nods with Feedback

Stand with your back and head against a wall. Place a small, thin pillow or towel roll behind your neck to

maintain its natural curve. Gently press the back of your head into the towel and perform a small chin tuck, trying to flatten your cervical spine against the wall without losing contact.

Why This is a Game-Changer for Your Jaw & Face

A strong Longus Colli is the anchor of proper head posture.

By pulling the cervical spine into a neutral alignment, it:

- Eliminates Forward Head Posture: This is the #1 cause of a recessed, weak-looking jawline.
- Reduces Jaw Clenching: When the head is balanced on the spine, the jaw musculature (masseter, temporalis) can relax.

- Opens the Airway: Improves breathing, which is linked to better facial development over time.
- Frequency: Perform these exercises daily. They are rehabilitation and postural work, not heavy strength training. Within 2-3 weeks, you will notice your head sits more naturally upright, and your jaw feels lighter.

OPERATOR NOTES: THIS IS HARD TO DO, IT IS RECOMMENDED FOR YOU TO LOCK INTO A CORNER OF THE ROOM AND BRACE YOURSELF AGAINST THE CORNER OF THE ROOM AND THE REST OF YOUR BACK AGAINST THE WALL, USE A THICK TOWEL AND PUSH YOUR HEAD INTO THE BACK OF THE TOWEL USING THE FRONT OF YOUR NECK THIS ELIMINATES TECH NECK.

Platysma

The Platysma is unique—it's a broad, thin sheet of subcutaneous muscle covering the front of the neck and lower jaw.

The "Neck Tensing" Isometric (The Foundation)

Sit or stand tall, looking straight ahead. Relax your face. Gently tense the skin of your neck by pulling one corner of your mouth downward (a subtle grimace) while tensing the neck. You should see the vertical fibers of the platysma engage. Bounce the muscle, start very slow, then speed up the reps till you end up doing it one per second.

X50 per side

Resisted Jaw Depression - One Side

Place the pads of your thumbs and the rest of the thumb underside under your chin. Open your mouth slightly,

then try to open it wider and press your jaw down against the resistance of your thumbs. You should feel one side is immediately weaker than one side, work the weaker side.

X60

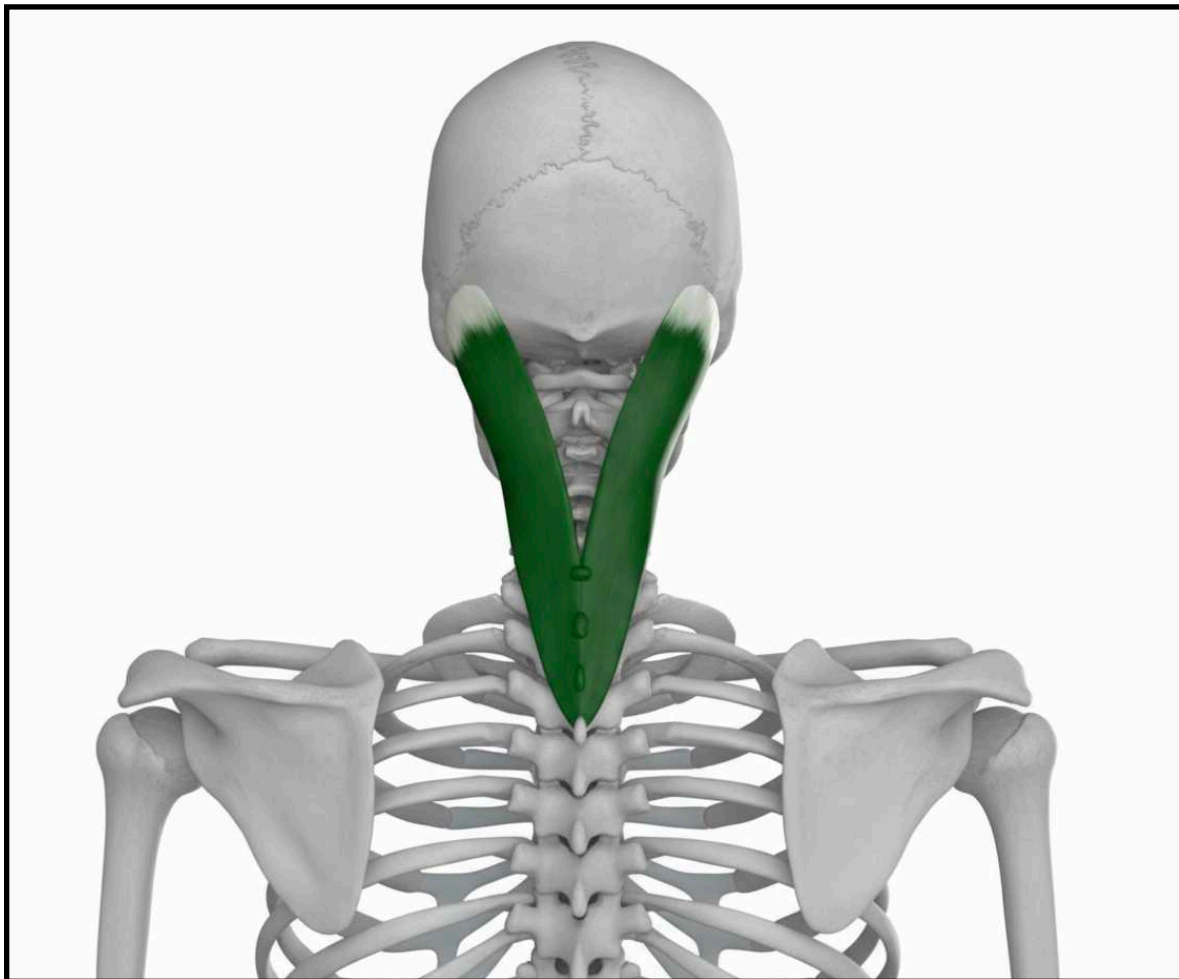

The "Lip Pull & Hold" (For Platysma-SCM Integration)

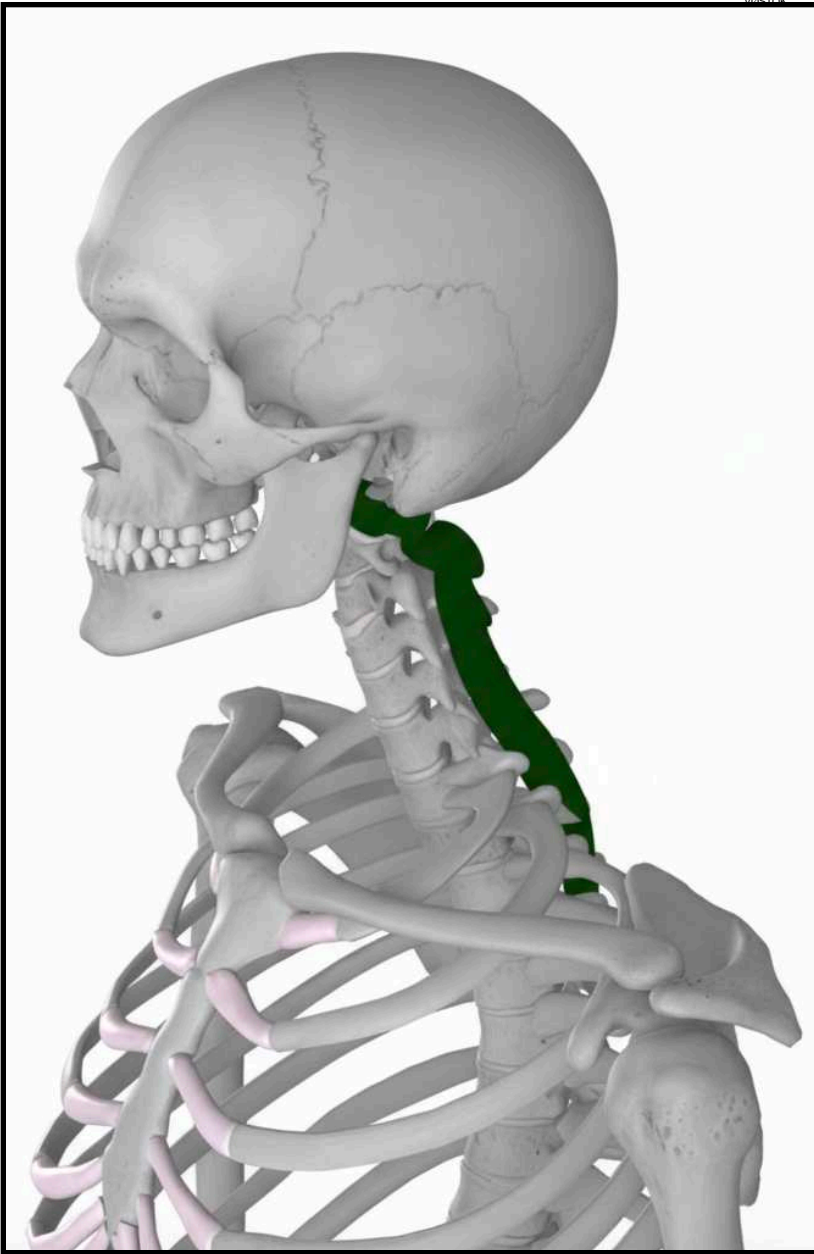

Pull your lower lip down firmly, exposing your lower teeth. While holding this, gently try to turn your head to one side. No need to use resistance, you should feel the tension immediately. Rotate mostly to the same spot, and then once again tense.

X20 for an overworked side, x60 for an underworked side

10.4 - Rear Neck Muscles

Splenius Capitis

The Splenius Capitis is a powerful, strap-like muscle in the back of the neck that is critical for a strong, defined, and balanced neck. It's a key anti-aging muscle for neck posture and contour.

This muscle can largely be better hit in the gym, so we won't focus too hard on it.

Function of the Splenius

Capitis

The Splenius Capitis is a powerful, strap-like muscle in the back of the neck that is critical for a strong, defined, and balanced neck. It's a key anti-aging muscle for neck posture and contour.

This muscle can largely be better hit in the gym, so we won't focus too hard on it.

Function of the Splenius Capitis

Location: Runs from the upper thoracic/lower cervical vertebrae up to the base of the skull (mastoid process).

Primary Actions:

- Extends the head (pulls the head backward, like looking up).
- Laterally flexes the neck (tilts the head to the same side).
- Rotates the head (turns the face to the same side).

Isolateral Tilt & Hold (For Lateral Flexion)

Place your right hand on the right side of your head.

Gently try to tilt your head to the right while using your

hand to provide steady resistance. Just tuck it back into the head, use light resistance.

X60, your weaker side should have two reps instead of one

Critical Safety & Stretching Protocol

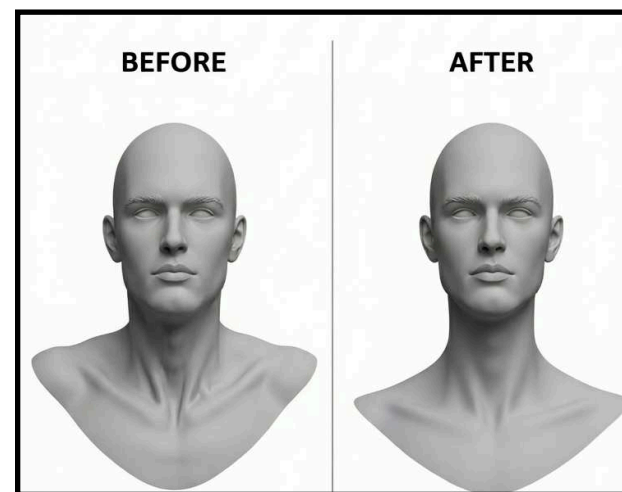

Never skip the stretch. A tight splenius capitis is a leading cause of tension headaches.

Stretch: To stretch the right Splenius Capitis:

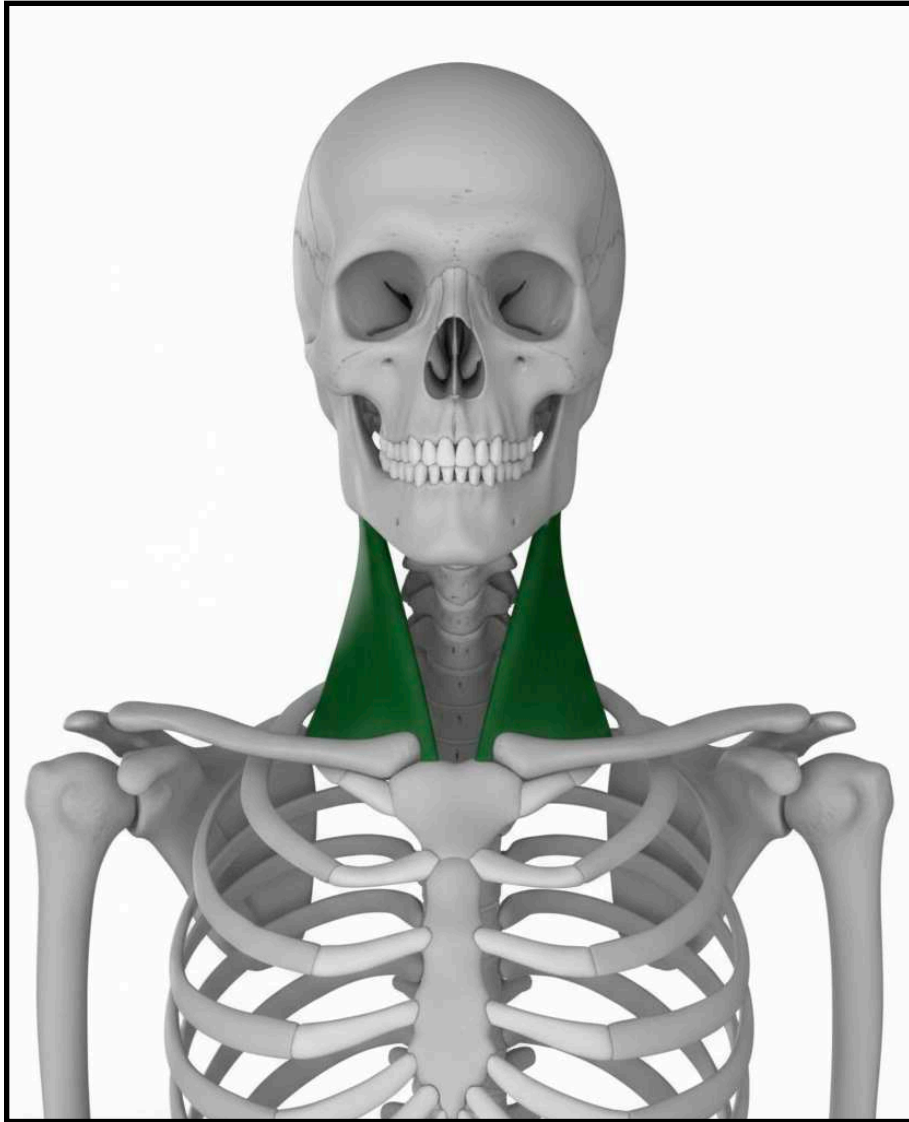

- Gently tilt your head forward and to the left.
- With your left hand, apply a gentle pull downward to deepen the stretch along the right side/back of your neck.
- Hold for 30 seconds. Repeat on the other side.

What This Does:

OPERATOR NOTES: THIS UNTENSES SO MANY KNOTS IN THE NECK, CAUSING THE NECK TO LOOK MUCH LONGER AND HELPS MUSCLE IMBALANCES

FROM SITTING TOO LONG. SO RELAXING. FEEL FREE TO DO MORE SETS ON THE SIDE THAT IS WEAKER, FOR EXAMPLE, WHEN STARTING I'VE DONE AS MANY AS THREE SETS ON MY WEAKER SIDE FOR JUST ONE ON MY STRONGER SIDE. ALSO, FEEL FREE TO PLAY AROUND WITH THE ANGLE OF THE HEAD, STRETCHING IT WAY BACK OR MORE TO THE SIDE.

Sternocleidomastoid

The Sternocleidomastoid (SCM) is the most prominent and defining muscle of the neck. Working it correctly is essential for neck strength, posture, and aesthetics, but it must be done with extreme precision to avoid strain or injury.

The Primary Exercise: Resisted Neck Flexion (Bilateral)

This builds the classic vertical "ropes" of the neck. Sit or stand tall. Place the palm of your hand flat on your forehead. Gently push your head forward while using your hand to provide firm, steady resistance. Keep your neck straight; do not let your chin drop to your chest.

X50 with each palm

OPERATOR NOTES: SETS THE HEAD PROPERLY ON THE NECK, YOUR NECK POSTURE SHOULD BE SLIGHTLY TILTED AND THIS EXERCISE ENSURES IT.

Isolateral (Side) Resistance (For Definition & Symmetry)

This targets each SCM individually to build definition. Place your right hand on the right side of your head. Gently try to tilt your head toward your right shoulder while using your hand to resist the movement. You can hold at first, then do reps. You will feel the left SCM (the one stretching) contract strongly to stabilize.

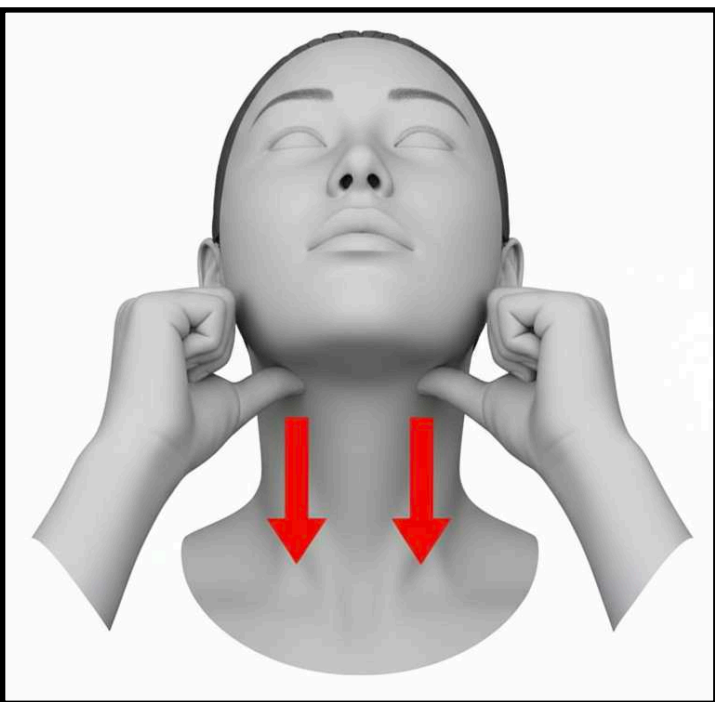

X80, each side

OPERATOR NOTES: THIS WILL UNTENSE SO MUCH CRAP, YOU WON'T BELIEVE IT. IT'S VERY LIKELY, ALMOST CERTAIN YOU HAVE ONE STERNOCLEIDOMASTOID SIGNIFICANTLY STRONGER THAN THE OTHER. WORK BOTH SIDES EQUALLY AS MUSCLE IMBALANCES ARE ONE OF THE BIGGEST PAINS OF THE BODY.

OPERATOR NOTES: THIS EXERCISE FEELS VERY GOOD FOR ANYONE THAT IS RIGHT OR LEFT HANDED TO AN EXTREME AND FOR EXAMPLE USES A MOUSE ALL DAY AT WORK, AS THE TENSION FROM THE HAND, THROUGH THE SHOULDER TO THE SIDE OF THE NECK CREATES A MUSCLE IMBALANCE, REALLY TAKE YOUR TIME WITH THIS ONE.

Massages

10.5 - Neck Massages

Simply push down with your thumbs along your jaw, spreading out the skin, do not push down on your thyroid. Run your thumbs all the way down the neck.

Aim for x20 times the first time, then x50 and eventually x100.

OPERATOR NOTES: THIS EXERCISE IS A 1/10. NOT VERY EFFECTIVE, CAN BE SKIPPED BUT HELPS. HELPS PREVENT A DOUBLE CHIN, HAS TO BE DONE A LOT. INCORPORATE INTO YOUR ROUTINE.

Do both sides, use two hands and plenty of oil to massage the down side of the neck. Do one hand after the other.

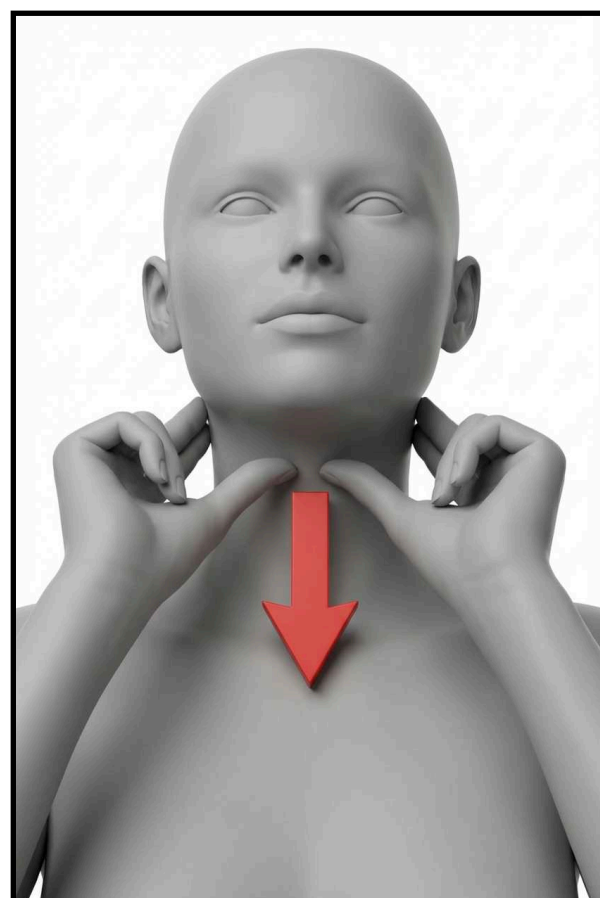

X50 to x100

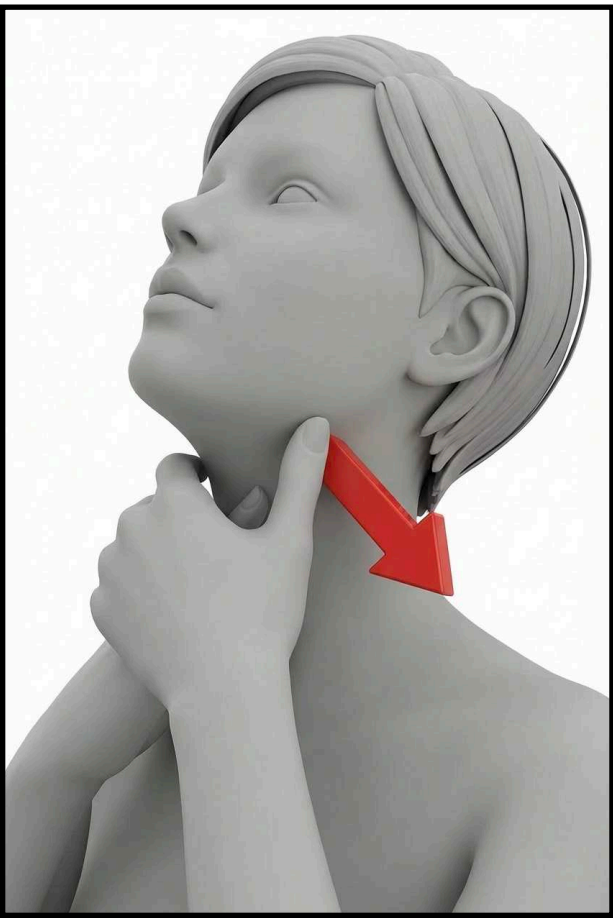

OPERATOR NOTES: WORKS REALLY WELL TO GET RID OF NECK LINES AND HELP DRAIN THE FACE SO IT'S NOT SO PUFFY.

Run your knuckles along and outward along the jaw to sharpen it. If you have facial hair, you'll want to shave before hand.

Run your thumbs down your neck around the thyroid, very gently and gingerly along the neck. Do not press into your neck. Use plenty of oil.

X20 to X40 each side

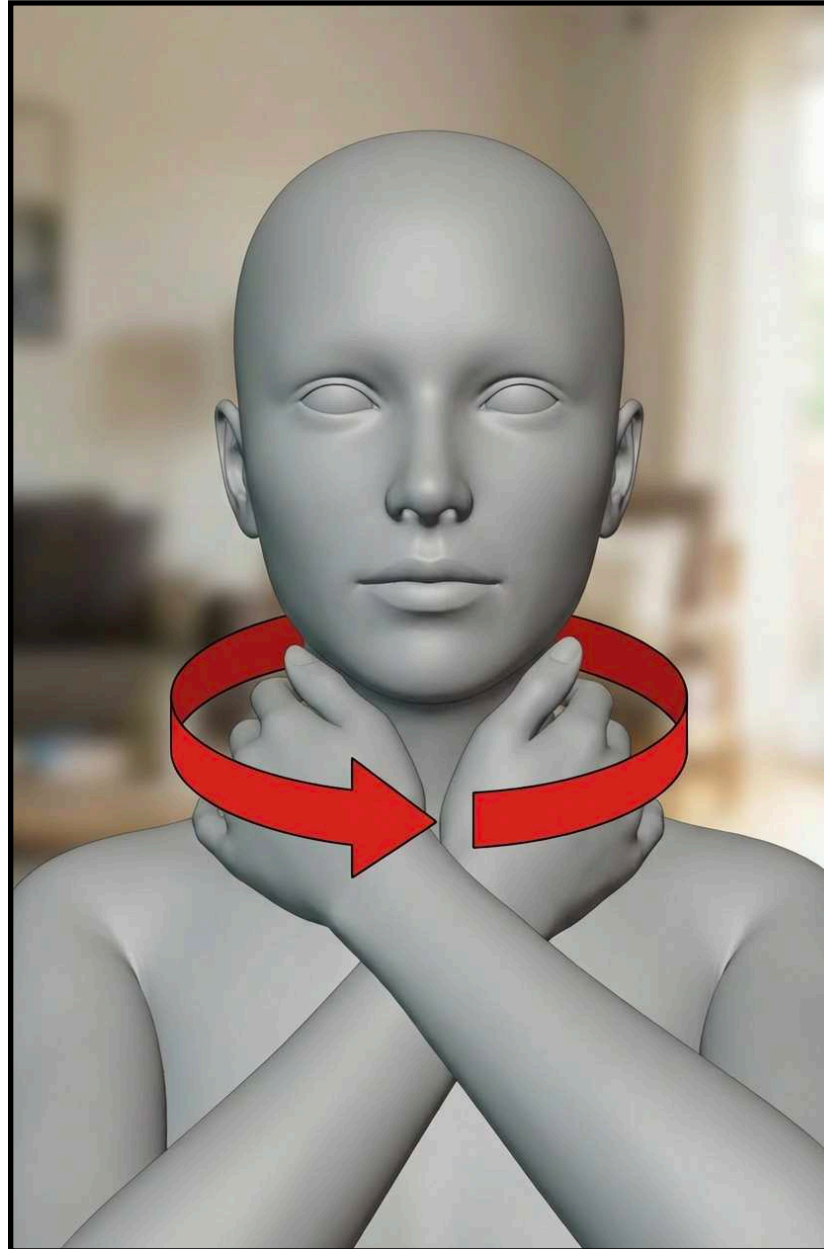

Rub your thumb down the edges of your jaw on both sides.

X50

Rub your palms all across the neck and push away the neck around the thyroid to get rid of lines.

Up to X100

Refinement

The Social Upgrade

As your looks improve, the world will begin to change around you. People will be friendlier, more engaging, and more open. Your social capital will rise. You'll notice subtle—then not-so-subtle—advances and attention you never received before.

Here's the fascinating shift:

You won't want your old life anymore.

Your habits will naturally elevate. You'll crave cleaner living, better sleep, disciplined exercise. You'll carry yourself with more confidence, and yes—you'll get away with more. You become what the world reflects back at you. If everyone treats you like someone of high value, you start to believe it, and then you begin to live it. It's a self-fulfilling loop of confidence and refinement.

STRUCTURAL ADAPTATION

Long-term mechanical tension alters visible neck structure.

Not by elongating bone—but by repositioning soft tissue and clavicular alignment over time.

NYX'S SUPERTIPS

DUAL NECK ELONGATION HOLD

HAND PLACEMENT

UPPER HANDS

Lightly placed at the underside of the jaw or base of the skull (occipital region), guiding upward alignment.

LOWER HANDS

Placed at the clavicle / base of the neck, applying gentle downward anchoring pressure.

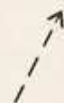

FORCE VECTORS

UPWARD ELONGATION

Extend the neck upward through the crown. Lightly guide the jaw or base of the skull upward—do not pull, only assist alignment.

CRANIAL ALIGNMENT GUIDANCE

Subtle diagonal upward-back vectors support optimal head positioning.

DOWNWARD ANCHORING

Apply gentle downward pressure at the base of the neck to stabilize the clavicular foundation.

INSTRUCTIONS

1. Apply gentle downward anchoring pressure at the base of the neck using both hands.
2. Simultaneously extend the neck upward through the crown of the head.
3. Lightly guide the jaw or base of the skull upward—do not pull, only assist alignment.
4. Maintain vertical expansion. No compression. No strain.

KEY PRINCIPLE:

Length is created through *opposing forces*—not forceful traction.

PROTOCOL

20 seconds

30 seconds

60 seconds

90 seconds

Progress gradually. Maintain posture. Breathe naturally.

OVER TIME:

- Improved cervical posture
- Reduced forward head position
- Increased visible neck length
- Enhanced jaw-neck separation
- Improved cranial alignment

Consistency defines outcome.

Chapter 11: Lifestyle, Facial Rollers, Supplements

11.0 - Face Rollers, Gua Sha

The face is teeming with fat and nerves. The fat in your face isn't just a uniform layer; it's organized into distinct, pillow-like compartments known as Fat Pads.

This compartmentalized structure is a key reason why we age the way we do—some pads shrink and atrophy with age, while others descend and bulge due to gravity and the weakening of retaining

ligaments.

Our Goal

Our mission is clear. As we age—and as we undertake this process of renewal—subtle markers of our years will naturally persist. After diligently applying the techniques in this book, the visible rejuvenation will be remarkable. Yet, if you were to photograph your face in a moment of tension—such as squinting against the sun—the underlying structural signs of age would still reveal themselves. This occurs because the delicate interplay of nerves, muscles, and fat pads within the face becomes disorganized over time. The solution is not merely to relax the expression, but to systematically reorganize these deeper layers. This is achieved by consistently countering gravitational pull over time, using tools like the Gua Sha stone and facial roller to lift, sculpt, and reassemble the foundation of your appearance.

The Primary Fat Pads of the Face

Here are the most significant fat compartments, categorized by their location:

Superficial Fat Pads (Just Under the Skin)

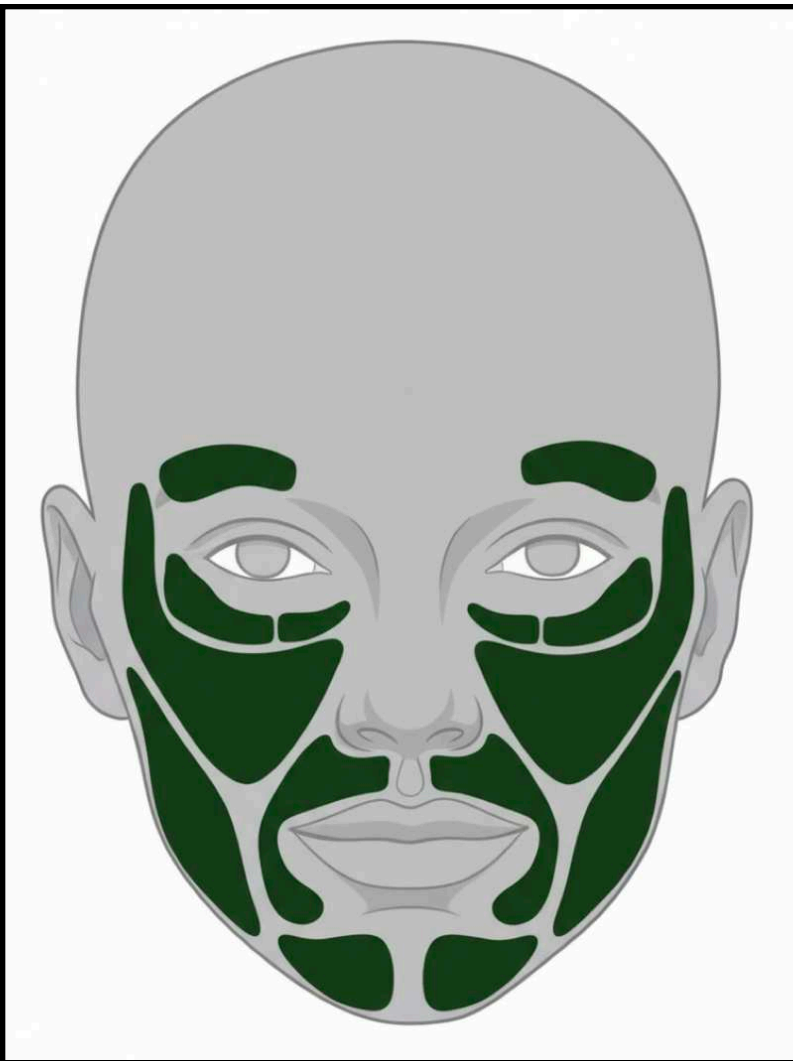

These are the most numerous and are primarily responsible for the face's soft, smooth contours.

- **Nasolabial Fat Pad:** This is the primary culprit for nasolabial folds (smile lines). With age, it tends to descend, creating a more prominent fold.
- **Malar Fat Pads:** These are the cheek pads. They are crucial for a youthful, lifted appearance. They are divided into three parts:

- Medial (closest to the nose)
- Middle (central apple of the cheek)
- Lateral (outer cheek, overlying the buccinator muscle)
- Buccal Fat Pad (of Bichat): A deep fat pad located in the hollow area beneath the cheekbones. It is largely responsible for facial volume in childhood. In adulthood, a large or ptotic (sagging) buccal fat pad contributes to jowling and fullness in the lower face. Its surgical removal (buccal fat removal) creates a more hollow-cheeked look.
- Jowl Fat: This isn't a distinct pad but rather the accumulation and descent of superficial fat and the buccal fat pad over the mandibular ligament, creating the dreaded "jowls."
- Pre-platysmal Fat: The fat located in the neck, just in front of the platysma muscle. This is the primary reserve for a "double chin."

Deep Fat Pads (Below the Muscles)

These provide structural support and projection to the face.

- Deep Medial Cheek Fat Pad (DMCF): This is arguably the most important fat pad for structural youthfulness. It sits deep to other pads and provides essential support to the overlying malar pads. Its atrophy and descent are a primary driver of midface aging, causing the entire cheek to fall.

- SOOF (Sub-Orbicularis Oculi Fat): Located beneath the orbicularis oculi muscle

(the eye muscle). Its descent contributes to under-eye bags and deepening of the nasolabial fold.

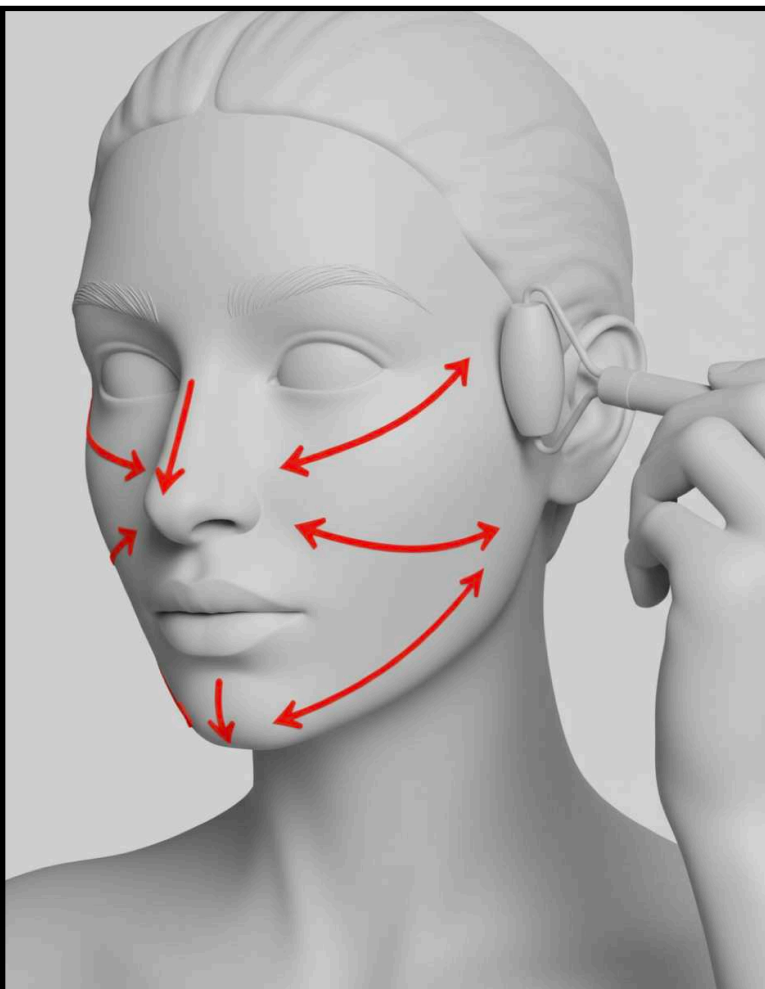

- ROOF (Retro-Orbicularis Oculi Fat): Located above the eye, in the brow area. It contributes to brow and upper eyelid fullness.

Aging is not just about volume loss: It's about compartmental descent and atrophy. Some areas need volume restored (e.g., the cheeks with the DMCF), while others may need volume reduced or lifted (e.g., the jowls from the buccal fat).

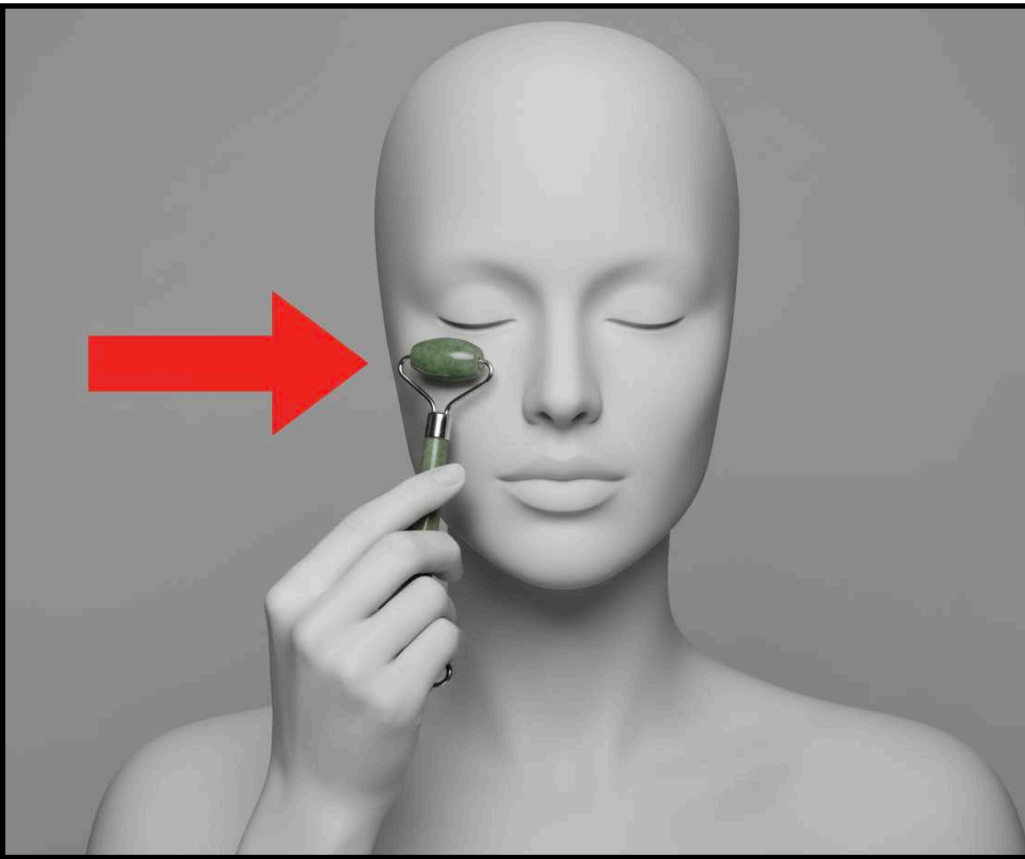

In order to modify our work and boost it, we need to “sculpt” the fat reserves and nerves of our face. The best way to go about it is to use a roller and a gua sha. These are such common items and there are plenty of video tutorials and shorts on how to accomplish these exercises.

Nonetheless, we will cover them here. The concept is simple, simply do each roll and gua sha technique 100 times and use plenty of oil. Do these exercises for a total of one hour.

Roll across the cheeks, up the

jawline, down the nose (careful with this one) and under the eyes.

Generally, you only want to pull away from the face. This is vital to help slowly but gradually “resculpt” the fat parts of the face.

Roll under the eye and across

the eye.

OPERATOR NOTES: OUR EYES TEND TO “BULGE” BECAUSE WE ARE STARING AT A SCREEN ALL DAY USUALLY; TV, A COMPUTER, A PHONE. THIS CREATES UNNECESSARY TENSION AND STRAINS THE EYEBALL FORWARD. THIS MASSAGE, SORT OF “POPS THE FLESH BACK IN”, IT REALLY ACCENTUATES THE EYE WORKOUTS AND WHEN COMBINED WITH THIS MASSAGE, HELPS GIVE THAT SLEEK “HUNTER EYE LOOK”.

11.1 - Gua Sha

The Gua Sha as a Counter-Gravity Treatment

The Gua Sha stone serves as an effective tool for addressing gravitational stress on facial tissues. The principle is straightforward: apply it to areas where gravity encourages sagging or loss of tone, and use gentle, upward strokes to provide a counter-lift.

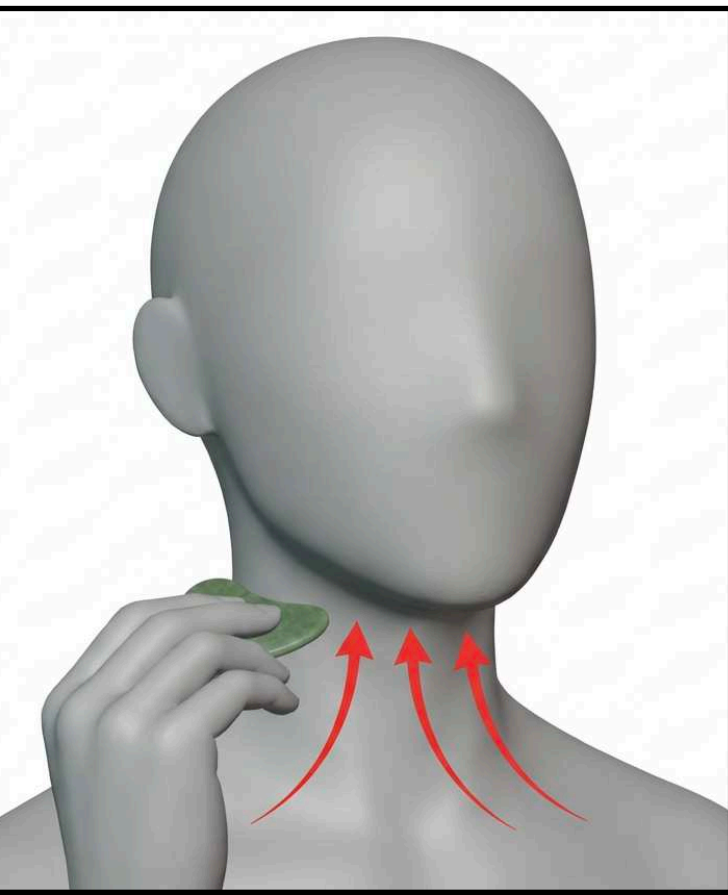

Method:

- Begin with a thoroughly cleansed face.
- Apply a generous amount of facial oil to ensure the tool glides smoothly without pulling the skin.
- Using the curved edge of the stone, apply light-to-moderate pressure and perform firm, upward strokes—always moving from the lower face toward the hairline and from the center outward.

- Follow the illustrated ideal stroke patterns (attached below). There is no strict time requirement, but a thorough session typically involves 50–100 repetitions per area.
- The treatment should be felt: you should sense the superficial facial fascia and soft tissue gently mobilizing beneath the stone.

Frequency:

This is a maintenance technique, not a daily routine. Performing a thorough session once per month or every few months is sufficient. Consistency in technique is more important than frequency—ensure each session is deliberate and complete.

Sculpt Up for the Neck

Use the gua sha, the middle part up against the neck, this will help get rid of wrinkles on the neck. You do 100 times on each side, then 100 times on the front (not up against the thyroid, but on the sides of it).

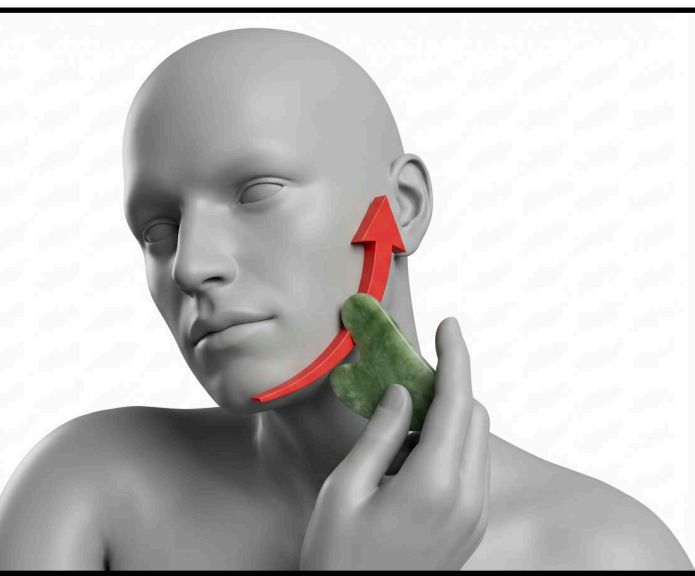

X100 each side

*What This
Does:*

Chin

Sculpting for the Jaw Line

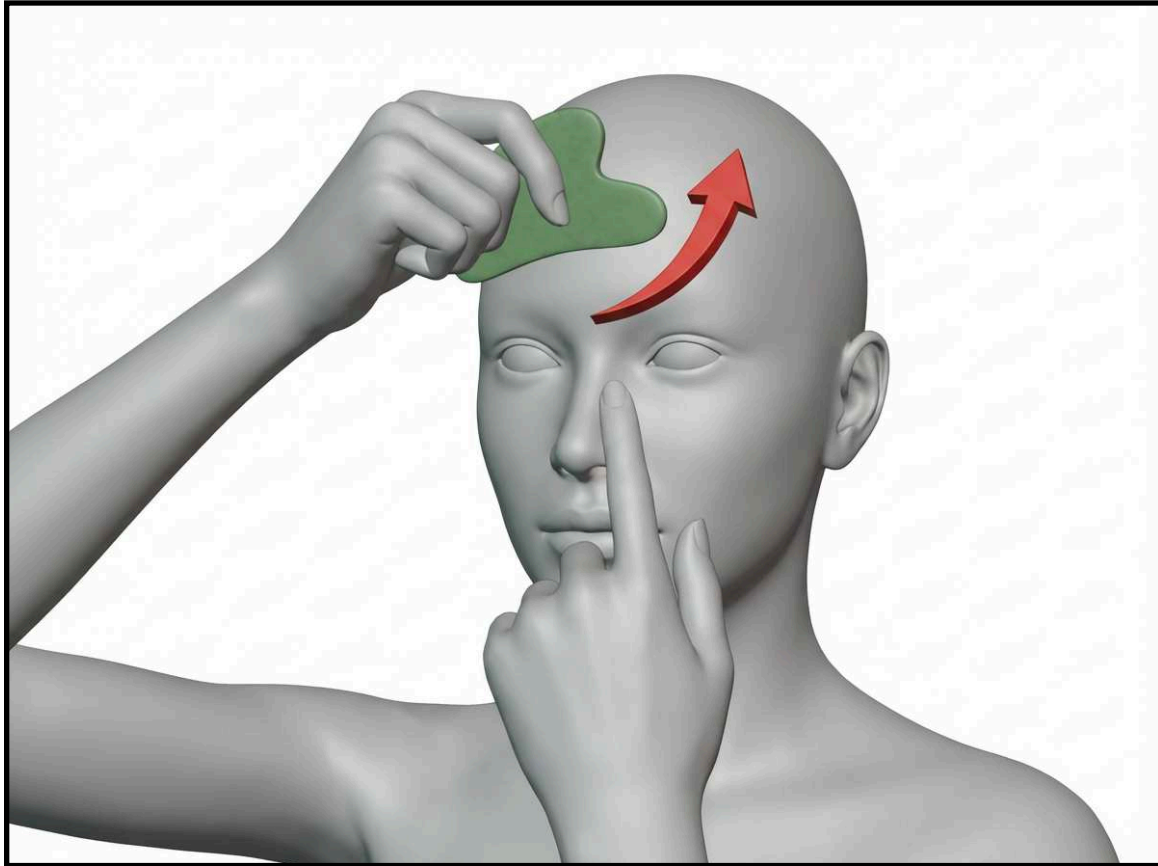

Use the gua sha, the middle part up against the edge of the jaw, starting from the middle of the chin and up and outwards along the entire jaw

line.

X100 each side

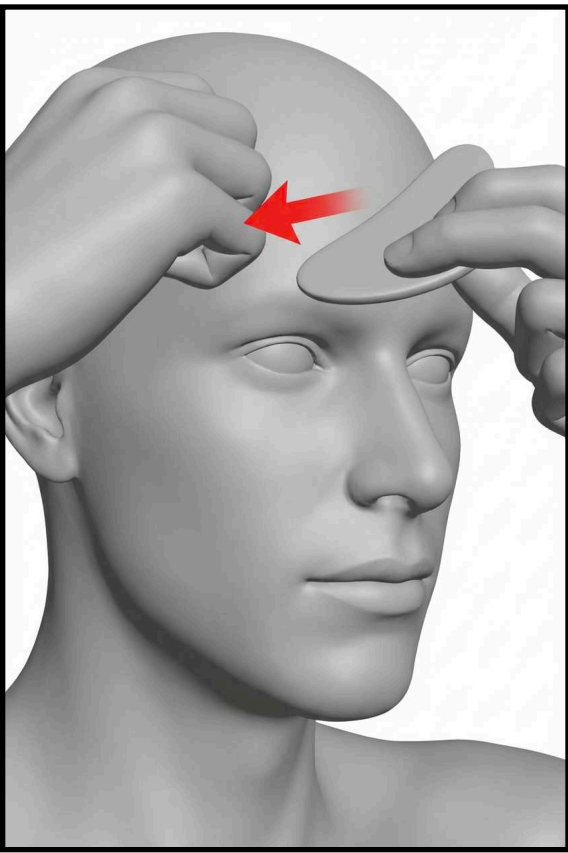

Sculpt Up for the Forehead

Use

the gua sha, the side curved part up against the front of the forehead, all along the forehead. Helps set the nerves and calm the forehead so you don't wrinkle it.

X100 each side

Sculpt Sides for the Forehead

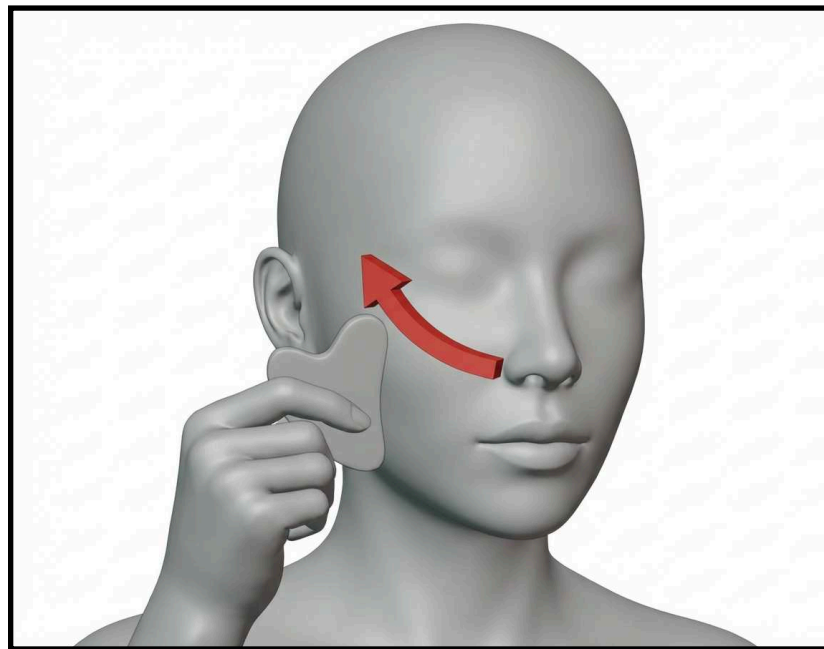

Use the gua sha, the side curved part up against the sides of the forehead, pulling along it up until the hairline. Do it up and against the side, think of a barber lining up with the lines of your forehead, just push the skin and nerves along to the edges - gently, with the gua sha.

X100 each side

Sculpt Cheek Contour

Use the gua sha, the side curved part up (and the opposite for some reps) starting from the nose, up through the cheeks up until the sides of the face.

X100 each side

11.2 - Supplements

For Acne-Prone Skin: A Practical Supplement Guide

Zinc - 4/10

Zinc is a foundational, low-risk starting point. It's very cheap and works systemically to reduce general skin inflammation and calm the overall activity of your oil glands, leading to fewer breakouts over time. While its effect can be subtle, it's notably non-toxic and well-

tolerated by most people, making it a reliable long-term ally.

Vitamin A - 7/10

This is your heavy artillery against aggressive, cystic acne. Vitamin A (particularly in the form of Retinoids) works by accelerating skin cell turnover, which helps to "unclog" pores and kill developing zits deep within the follicle. However, approach with caution: high doses can be harder to source

in some countries and, more importantly, have been linked to depressive symptoms in a small subset of users. Start low, gauge your body's response, and never megadose.

Niacin (Vitamin B3) - 5.5/10

Niacin is a fantastic multi-tasker for pore refinement and skin resilience. It helps to strengthen the skin's barrier function, which in turn makes pores appear smaller and behave more controlled. By improving the skin's overall health and

reducing inflammation, Niacin creates an environment where acne is less likely to form in the first place, giving you a smoother, more even complexion.

The Glow Up Protocol: A Practical Supplement Guide

Vitamin E - 2/10

Vitamin E is a powerful antioxidant that acts as a subtle, systemic glow-getter. It's the secret behind that "vacation radiance"—not just from the sun, but from the internal protection against environmental damage that makes skin look healthier and

more vibrant. It's cheap and practical, though high doses can have a mild laxative effect for some.

GABA (Gamma-Aminobutyric Acid) - 10/10

Stress is the ultimate ager, and GABA is a direct countermeasure. As a calming

neurotransmitter, it helps reduce background anxiety over time, softening the tense facial expressions and worry lines that make you look "unhot." It's a concentrated form of mental relaxation, which is the foundation of a youthful demeanor. It's pricier than basic supplements, and some users report a transient, mild tingling

or warmth on the skin.

Calcium - 6/10

Primarily a foundational mineral for strong, healthy teeth and bone structure. A key caution: avoid taking it right before bed initially, as its role in nerve conduction can, for some, lead to unusually vivid or intense dreams. Never

megadose, as excessive calcium can paradoxically lead to a sensation of tooth brittleness and other health issues. When used correctly, it's a solid choice for structural support.

NMN (Nicotinamide Mononucleotide) - 9/10

This is a top-tier contender for cellular de-aging. It works by boosting NAD⁺ levels, a coenzyme critical for energy production and cellular repair,

effectively helping to clear out senescent ("zombie") cells.

The effect can be a more youthful, "neotenous"

appearance. However, it is very powerful and expensive.

Cycle it (e.g., a few weeks on, a few weeks off) to be gentle on the kidneys. Overtaking it can lead to undesirable side effects like pale, molting-looking skin, undermining the very goal you're trying to achieve.

Oleuropin (from Olive Leaf Extract) - 6/10

Oleuropin is a potent antioxidant derived from the olive leaf, known for triggering a powerful, long-term "skin reboot." The initial phase can be deceptive; it may cause a slight dullness or tired appearance as the skin begins to shed its outer layer. This is a precursor to its true effect: a significant and radiant glow that emerges as new, healthier skin cells surface. It is usually quite expensive and requires a strategic approach: always take it with food to prevent stomach cramps, and cycle it (e.g., one week on, three weeks off) to allow the body to respond optimally. The rewards are profound, but they require patience and disciplined use.

Castor Oil - 3/10

Castor oil's efficacy for scalp hair growth is debated. It may coat individual hairs, creating an illusion of thickness, but evidence for stimulating new growth is

lacking. Its benefits for facial skin are also limited due to its thick, comedogenic nature, which can clog pores.

However, castor oil excels as a conditioning treatment for existing hair. Its ricinoleic acid content acts as an excellent emollient and humectant, making it particularly effective for enhancing the appearance of eyebrows, eyelashes, and beard hair.

Primary Use: Eyelash & Eyebrow Conditioner

- Application: Before bed, apply a minimal amount to a clean spoolie or cotton swab.
- Method: Gently brush onto clean eyebrows. For lashes, carefully apply to the lash line and flick the spoolie upward, coating the lashes from root to tip.
- Critical Caution: Avoid direct contact with the eyes. If oil gets in, rinse immediately with cool water.
- Duration: Apply nightly. Consistent use for 2-4 weeks is required to see a noticeable improvement in hair thickness, strength, and length.
- The same conditioning properties can help soften coarse beard hair and improve manageability, though it does not stimulate new follicular growth.

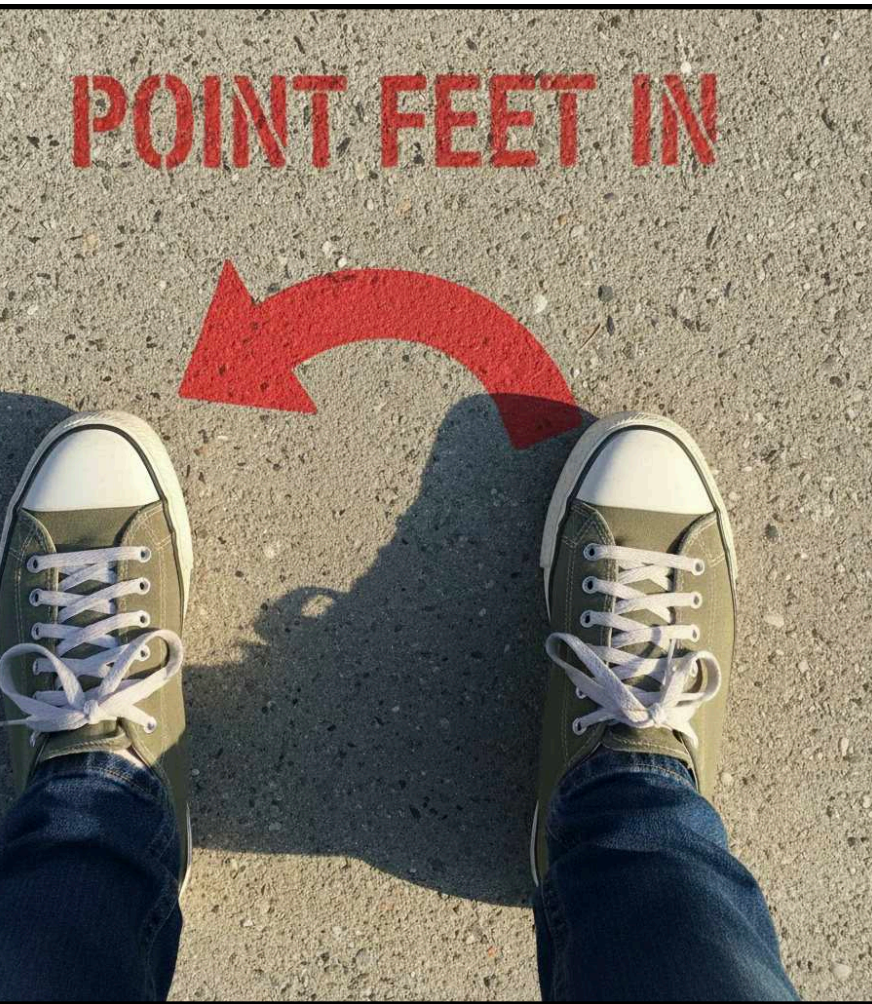

Summary: Think of castor oil not as a growth stimulant, but as a targeted conditioning sealant for the short, delicate hairs on the face. It improves their health and appearance but will not create hair where none exists.

11.3 - General Lifestyle Principles

The Foundation of a Relaxed Jaw: Your Walk

For A Proper Walk and Jaw

Think of your body as a kinetic chain, where the position of your feet sets off a ripple effect that travels all the way to your jaw. For many, a slight internal rotation of the feet (toes pointing slightly inward) during a walk can help release chronically tight hip external rotators. This simple adjustment encourages better pelvic alignment, which in

turn reduces compensatory tension in the lower back, shoulders, and neck. Since the muscles of your jaw are intimately linked to your cervical posture, this reduction in upper-body strain can, over time, signal the masseters and temporalis muscles to relax, directly combating the clenching that

exacerbates a recessed jawline.

For A Confident Walk

Your walk should be grounded and intentional. Focus on pressing through the entire sole of your foot, avoiding a light, tapping motion on the top of your foot—a common

sign of ill-fitting shoes that disrupts this entire kinetic chain. While a slightly turned-out gait can project confidence in short bursts, it often engages different, potentially tightening muscle patterns and is not recommended as a foundational practice. The goal is not a dramatic pigeon-toed walk, but a subtle internal

rotation that creates a stable, aligned foundation from the ground up, ultimately teaching your body—and your jaw—to release.

The Silk Pillowcase Advantage: More Than Just Luxury

Let's talk about one of the simplest upgrades for your skin and hair: switching to a silk pillowcase. While it

won't solve severe cystic acne on its own, it's a powerful supporting actor in your overall routine. The logic is straightforward. Unlike cotton, which has a rough, absorbent weave that creates friction and can trap bacteria, silk is incredibly smooth and hypoallergenic.

This smoothness provides a dual benefit. First, it drastically reduces friction against your skin. This means less irritation, fewer sleep-crease lines, and a lower

likelihood of friction-induced breakouts. Second, and more importantly, silk doesn't have the loose, fibrous threads that can microscopically detach and work their way into your pores, acting as a minor irritant that contributes to clogging.

OPERATOR NOTES: IF YOUR BREAKOUTS ARE CONCENTRATED ON THE SIDES OF YOUR CHEEKS AND YOU'RE A STOMACH OR SIDE-SLEEPER, THIS INVESTMENT IS PARTICULARLY WELL WORTH IT. YOU ARE LITERALLY REPLACING THE PRIMARY IRRITANT YOUR FACE PRESSES AGAINST FOR HOURS EACH NIGHT. A FINAL, NON-NEGOTIABLE TIP: NEVER MACHINE DRY THE PILLOWCASE. THE INTENSE HEAT SHREDS THE DELICATE SILK FIBERS. ALWAYS WASH IT GENTLY AND LET IT AIR DRY TO PRESERVE ITS SKIN-SAVING PROPERTIES. FOR A PROBLEM AS COMPLEX AS ACNE, A SILK PILLOWCASE IS A PASSIVE, AND ELEGANT INTERVENTION THAT TILTS THE ODDS IN YOUR FAVOR EVERY SINGLE NIGHT.

11.4 - Skincare Rejuvenation

The Non-Negotiable Hygiene Protocol: A Critical Warning!!!

This is one of the most potentially dangerous procedures in this entire guide. Introducing hundreds of microscopic channels into your skin is an open invitation for bacteria to cause a significant and severe infection. Therefore, a strict hygiene protocol is non-negotiable. Before application, your hands must be sterilized—either by using disposable nitric oxide gloves or by thoroughly

spraying your hands with rubbing alcohol and then washing them off with soap. Your face must be meticulously cleansed with a proper facial cleanser to remove all dirt and oil, followed by a pass with a small amount of rubbing alcohol to kill surface bacteria. You must never, under any circumstances, reuse a derma roller pen needle head; each session requires a fresh, sterile unit. It is absolutely vital that you watch a detailed tutorial online to understand the proper technique and fully internalize this sterile process before you even consider beginning. There is zero room for error here.

The Derma Roller Pen: A Controlled Invasion

A derma roller pen is a device covered in fine, medical-grade needles that create microscopic channels in the skin. This controlled, minor injury is a fantastic way to dramatically enhance product absorption and stimulate the skin's natural healing process, which ramps up collagen and elastin production. It is one of the most effective at-home tools for significantly improving the appearance of acne scarring and overall skin texture.

The key is to not overdo it. Counter-intuitively, a pen with more needles that are smaller in length (e.g., 0.25mm) is generally less irritating and safer for beginners, as it creates finer, more superficial channels. You do not need an expensive device; a cheap, sterile pen bought from a reputable online seller is perfectly adequate.

Protocol is everything. Always start with the lowest needle setting. The maximum frequency should be no

more than twice a week for very short needles, and for deeper treatments targeting scars, once a month is often more applicable. Overuse will damage your skin barrier, causing more harm than good. A noted side benefit is that this process has been clinically shown to help regrow hair by stimulating dormant follicles, though it is not a miracle cure for baldness—once a hair follicle is completely dead and gone, it cannot be revived. Used with discipline, the derma roller is a powerful tool for taking your skin's health into your own hands.

11.5 - The Do's and Dont's

Don'ts:

Do not use steroids. They can cause severe damage to your body, permanently disrupt your hormonal system, and are unnecessary for attractiveness. The extreme muscularity they produce is often of greater interest to other men than to potential partners.

Avoid dangerous practices like "bonemashing." This refers to the harmful trend of striking one's head in a misguided attempt to alter bone structure. This is both ineffective and extremely hazardous. The brain does not regenerate like other tissues, and such actions can lead to permanent brain damage.

Dos:

Incorporate regular jogging and sensible sun exposure. As humans, we are biologically adapted for endurance running. Regular jogging supports physical and mental health. Similarly, moderate sunlight helps regulate our circadian rhythms and overall well-being.

Increase your consumption of whole fruits. While fruits contain natural sugars, they are a source of beneficial nutrients, fiber, and "good" sugars as part of a balanced diet.
